Producción**

“Diseño de un sistema de climatización para “The Garden Plaza”, un  
edificio hotelero y comercial ubicado en el cantón Daule”

**PROYECTO INTEGRADOR**

Previo la obtención del Título de:

**Ingeniero Mecánico**

Presentado por:

Byron Alberto Bajaña Toledo

José Miguel Urueta Mocha

GUAYAQUIL - ECUADOR

Año: 2020

## **DEDICATORIA**

A Dios, a mis padres, y seres queridos por siempre estar presentes apoyando y animando en todo momento.

## **AGRADECIMIENTO**

Agradezco a Dios en primer lugar ya que sin su voluntad nada de esto sería posible. Agradezco a mis padres que con sacrificio y paciencia estuvieron apoyándome en todo momento, así como a cada una de las personas que de una u otra manera hicieron posible que yo culmine esta etapa de mi vida. El esfuerzo de las personas nunca será en vano y este logro es para esas personas que ocupan un lugar en mi corazón. Finalmente agradezco a ESPOL por forjarme con carácter, perseverancia y disciplina ya que sin esas cualidades nada de esto pudiera ser posible. Muchas gracias de todo corazón.

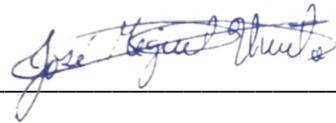

## DECLARACIÓN EXPRESA

“Los derechos de titularidad y explotación, nos corresponden conforme al reglamento de propiedad intelectual de la institución; *Byron Alberto Bajaña Toledo* y *José Miguel Urueta* damos nuestro consentimiento para que la ESPOL realice la comunicación pública de la obra por cualquier medio con el fin de promover la consulta, difusión y uso público de la producción intelectual”

## RESUMEN

La empresa SERMATECNICA requiere climatizar un hotel "THE GARDEN PLAZA" ubicado en el cantón Daule a la altura de Plaza Tía de la urbanización La Joya. Para esto fue necesario un estudio y valoración de los diferentes tipos de sistemas de climatización que podrían ser instalados. Los 3 sistemas principales que se plantearon fueron los siguientes: Expansión directa, sistema VRF y Sistema Chiller de agua helada. Cada uno posee virtudes y desventajas las cuales fueron analizadas al momento de la selección. Para poder determinar cuál podría ser la mejor opción se realizó un análisis de carga térmica del hotel, obteniendo como resultado un total de 129 [Ton] para climatizar todo el hotel. La selección se basó en las características principales de cada sistema, así como los requerimientos del cliente. El sistema seleccionado fue el sistema VRF debido a su versatilidad y eficiencia. Se procedió a implementar dicho sistema, realizando planos detallados de ubicación y especificaciones tales como calibre y recorrido de cañerías de cobre, así como el análisis de costos de inversión dando como resultado un valor aproximado de \$190,000. La inversión se justifica debido al ahorro que pueda llegar a tener en consumo eléctrico, ya que el consumo mensual podría estar por debajo de otros sistemas tales como el de expansión directa en un valor aproximado de \$1530 aproximadamente como valor mínimo de ahorro. A lo largo de este documento se proporciona los datos necesarios para la implementación de este sistema.

**Palabras Clave:** Climatización, carga térmica, eficiencia, inversión.

## **ABSTRACT**

*The company "SERMATECNICA" requires air conditioning in the hotel "THE GARDEN PLAZA" located in Daule close to "Plaza Tía" in urbanization "La Joya". For this, a study and assessment of the different types of air conditioning systems that could be installed was necessary. The 3 main systems that were proposed were the following: Direct expansion, VRF system and Chiller system of chilled water. Each one has virtues and disadvantages which were analyzed at the time of selection. In order to determine which could be the best option, an analysis of the hotel's thermal load was carried out, obtaining as a result a total of 129 [Ton] to air-condition the entire hotel. The selection was based on the main characteristics of each system as well as the client's requirements. The system selected was the VRF system due to its versatility and efficiency. Said system was implemented, making detailed plans of location and specifications such as gauge and route of copper pipes, as well as analysis of investment costs resulting in an approximate value of \$ 190,000. The investment is justified due to the savings that it may have in electricity consumption, since the monthly consumption could be below other systems such as the direct expansion system by an approximate value of approximately \$ 1,530 as a minimum saving value. Throughout this document the necessary data for the implementation of this system is provided.*

**Keywords:** *Air conditioning, thermal load, efficiency, investment.*

# CAPÍTULO 1

## 1. INTRODUCCIÓN

### 1.1 Definición del Problema

La empresa SERMATECNICA requiere diseñar un sistema de climatización para un edificio que será construido en el cantón Daule, el diseño debe tener el respectivo análisis de cargas basándose en normas ASHRAE y en normas locales, dimensionamiento y selección de equipos y materiales a ser instalados, análisis costo energético, costos de instalación y puesta en marcha. Para resolver el problema se debe tener en cuenta la ubicación del edificio, número de plantas que tendría el mismo, la distribución de las diferentes áreas, las actividades que se realizarán en cada área, así como los equipos y máquinas presentes en cada una de ellas. Además de todos estos aspectos, se debe tomar en cuenta también las condiciones ambientales de la ciudad, así como las condiciones que se requiere que cada área del edificio tenga.

### 1.2 Justificación del proyecto

En función al problema descrito, se busca diseñar un sistema de climatización que cumpla con las especificaciones y requerimientos de la empresa y a su vez sea sostenible y eficiente. Los sistemas de climatización son esenciales en todos los edificios para generar confort en las personas. Debido a que los sistemas convencionales de climatización consumen una gran potencia eléctrica, se determinó la necesidad de diseñar un sistema de climatización que permita cubrir las necesidades y especificaciones de la empresa, a más de ser un sistema que sea eficiente y permita ahorrar energía. Adicionalmente se busca también minimizar los gastos de inversión en lo relacionado a las facilidades de instalación, disponibilidad de equipos y tiempo de entrega, sin descuidar el aspecto técnico. Para lograr esto, se analizarán diversas alternativas de sistemas de climatización y se seleccionará la que mejor cumpla con los criterios de costo – beneficio, contrastando el valor de inversión y el valor que puede ahorrarse a mediano o largo plazo, facilidades

de instalación, disponibilidad de equipos y tiempo de entrega, sostenibilidad y costo energético, así como impacto ambiental del mismo.

### **1.3 Objetivos**

#### **1.3.1 Objetivo General**

Diseñar un sistema de climatización centralizado para un edificio empleando las normas ASHRAE y criterios de ingeniería

#### **1.3.2 Objetivos Específicos**

1. Calcular las cargas térmicas del edificio de acuerdo a los procedimientos ASHRAE.
2. Analizar las posibles alternativas de solución para el diseño del sistema de climatización.
3. Seleccionar y dimensionar los equipos y materiales que se instalarían en el edificio.
4. Realizar un análisis de costos para la alternativa de solución.

### **1.4 Marco teórico**

#### **1.4.1 Acondicionamiento de aire**

Según Pita (2002), "El acondicionamiento de aire es el proceso de tratamiento de este en un ambiente interior con el fin de establecer y mantener los estándares requeridos de temperatura, humedad, limpieza y movimiento" (pág. 2). Lo cual requiere del control de todas estas condiciones. Controlar la temperatura del aire implica enfriarlo o calentarlo. La humedad, es decir, el contenido de vapor de agua que hay en el aire, se puede controlar agregando (humidificación) o quitando vapor de agua (deshumidificación) del aire. La limpieza del aire es controlada mediante 2 alternativas: por filtración, es decir, eliminar contaminantes presentes en el aire con la ayuda de filtros u otros dispositivos, o a través de ventilación, que consiste básicamente en ingresar aire del exterior al espacio interior con el fin de reducir la concentración de dichos contaminantes en el aire.

Debido a que el objetivo de los sistemas de climatización es garantizar un ambiente confortable, se requiere la comprensión de los diversos factores que influyen en el confort humano. Uno de estos factores es la emisión de calor corporal, la cual está influenciada por otros factores como la temperatura, humedad y movimiento del aire, así como las prendas de vestir. Otro factor importante en el confort es la calidad del aire, la cual depende del grado de pureza de este, pues éste empeora con la presencia de contaminantes como olores, humo, polvo, o gases. A esto se debe la importancia de la ventilación y filtración. (Pita, 2002)

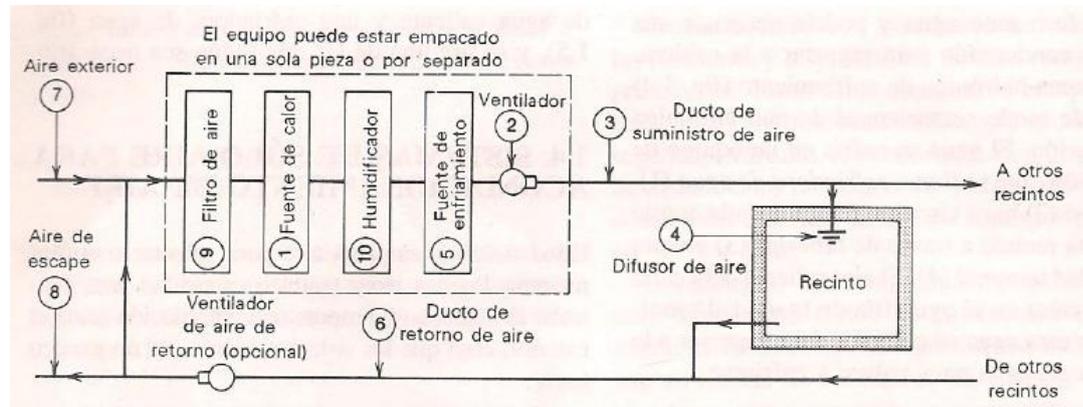

#### 1.4.2 Sistemas de climatización

Los sistemas de climatización se diseñan para cumplir con el propósito de mantener condiciones de temperatura, humedad, y pureza del aire, en niveles adecuados que permitan el confort de las personas que se encuentran dentro de determinado espacio, así como el ruido, la potencia y consumo de energía en niveles adecuados. (Pita, 2002)

Los sistemas de climatización se pueden clasificar en:

**Sistemas de expansión directa.** - La transferencia de calor ocurre directamente entre el refrigerante, el medio exterior y los ambientes que se requiere climatizar. Dentro de esta categoría se encuentran los denominados equipos aire–aire, que extraen calor del ambiente climatizado y lo transfieren al aire exterior. También están los sistemas agua–aire, en cuyo proceso de condensación usan agua. Estos equipos condensados por agua generan menos ruido que los condensados por aire, además aportan más potencia frigorífica y calorífica para un mismo consumo de potencia. En los sistemas de expansión directa hay menores pérdidas de rendimiento debido a extracción de calor en cañerías. La figura 1.1 muestra un sistema de sólo aire para enfriamiento y calefacción. El aire se enfría en la fuente de enfriamiento que puede ser un serpentín que contiene un fluido frío. Un ventilador hace circular este aire frío y lo distribuye por medio de ductos a todo el recinto. En cada habitación los difusores de aire se encargan de distribuir el aire en cada espacio. Los ductos de retorno de aire permiten desalojar aire ya que el mismo volumen de aire que entra de e salir. Así

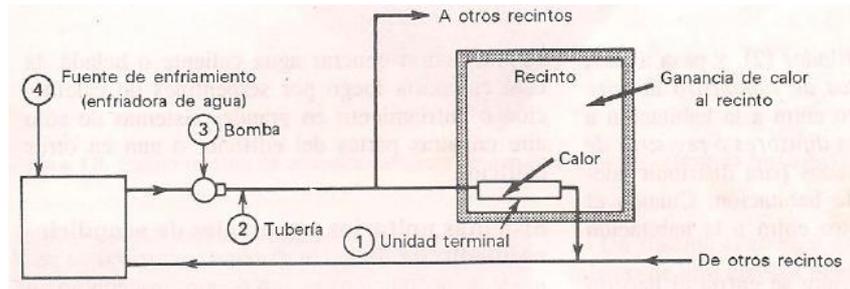

este aire se vuelve a enfriar y repite el proceso. Es posible añadir filtros y demás dispositivos para humidificar el aire.

**Figura 1.1 Componentes básicos de un sistema todo aire para calefacción y enfriamiento.**  
Fuente: Pita, 2002

**Sistemas de expansión indirecta.** - Los sistemas de esta categoría utilizan un fluido intermedio al que se le cede o extrae calor del refrigerante que circula por la unidad condensadora. EL fluido intermedio o refrigerante secundario es generalmente agua. Los sistemas de agua fría son muy recomendados para grandes sistemas de acondicionamiento de aire por sus ventajas de distribución y centralización. El agua es enfriada por intercambio de calor con el refrigerante, y luego se distribuye a los espacios para el acondicionamiento del aire. Los sistemas de enfriamiento por agua se clasifican según el medio utilizado para el intercambio de calor con el refrigerante en el condensador. Existen los sistemas agua-agua o hidrónicos, que aprovechan el calor específico del agua y su calor latente de vaporización.

La figura 1.2 muestra la disposición de los componentes básicos de un sistema hidrónico de enfriamiento. El agua se enfría en una enfriadora de agua para luego hacerla circular con una bomba por todo el recinto a través de las tuberías hasta llegar a las unidades terminales. Finalmente, el agua retorna a la unidad enfriadora de agua.

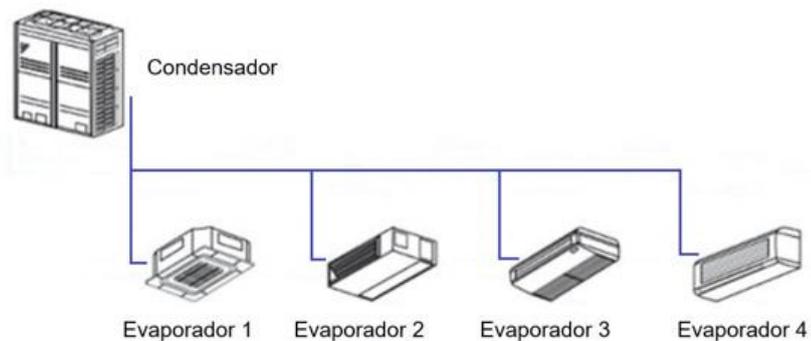

**Figura 1.2 Componentes básicos de un sistema de enfriamiento mediante agua helada.**  
**Fuente: Pita, 2002**

Están también los sistemas aire-agua, en los que se toma aire del ambiente, pero debido a su bajo calor específico es necesario mover grandes cantidades de este, haciendo que sea necesario el uso de ventiladores.

#### **1.4.2.1 Sistemas de volumen de refrigerante variable para el acondicionamiento de aire**

Los sistemas de Caudal de Refrigerante Variable son sistemas de climatización relativamente modernos y más sofisticados que otros sistemas. Comercialmente se conocen con las iniciales en inglés VRF (Variable Refrigerant Flow), VRV (Variable Refrigerant Volume) o en español CVR. Es un sistema multi-split de expansión directa que posee una unidad externa común que se conecta mediante tuberías de cobre a múltiples unidades internas que operan individualmente dentro de las habitaciones según la demanda de temperatura. La unidad exterior del sistema VRF se encarga de evaporar (calor) o condensar (frío) el gas refrigerante. El refrigerante se distribuye por las tuberías hasta llegar a los diferentes espacios donde las unidades interiores se encargan de utilizarlo para enfriar o calentar. Estos sistemas permiten adaptar el consumo de energía eléctrica acorde a la demanda, ya que tienen la virtud de poder variar la cantidad de refrigerante enviado a cada unidad interior en función de la demanda por medio del sistema de control del sistema que se encarga de operar las válvulas de expansión. La figura

1.3 muestra un esquema básico de un sistema VRF en el cual la unidad condensadora se conecta a las diferentes unidades interiores o evaporadoras que funcionan independientemente una de otra.

**Figura 1.3 Esquema básico de Sistema VRF**  
Fuente: Elaboración Propia

Este sistema funciona con tecnología inverter en su compresor, haciendo que el motor del compresor varíe su frecuencia de tal manera que trabaja a mayor o menor velocidad, dependiendo de la información recibida del sistema de control del sistema de acuerdo con la demanda. El volumen de refrigerante suministrado a las unidades interiores dependerá de la velocidad a la que trabaje el compresor, lo que a su vez hace que aumente o disminuya el calor absorbido/cedido al ambiente climatizado, así la temperatura del local se controla de manera más precisa. Este funcionamiento evita paros y puestas en marcha del compresor, lo que a su vez constituye un beneficio desde el punto de vista de eficiencia y ahorro energético, ya que el compresor no trabaja todo el tiempo a su máximo rendimiento. Esto los hace muy recomendados para edificios e instalaciones comerciales de medio o gran tamaño debido a su gran eficiencia y ahorro energético.

Existen sistemas VRF de 2 tubos y de 3 tubos. El sistema de 2 tubos puede proporcionar frío o calor, pero no ambos a la vez. En cambio, el sistema de 3 tubos, denominado "Sistema VRF con recuperación de calor", puede suministrar frío y calor a la vez. Son capaces de cumplir con dos funciones: ventilar las zonas internas y recuperar una parte de

la energía que se expulsa a través del aire de extracción. Por ejemplo, si hay varios equipos trabajando en modo de refrigeración, parte del calor de la condensación que se perdería en el exterior, se envía a las unidades interiores que están trabajando en modo de calefacción lo cual permite reducir aún más el consumo energético. Sin embargo, la instalación de un sistema de 3 tubos encarece significativamente la inversión.

Existen otros tipos de sistemas VRF según su unidad exterior: Sistema axial y Sistema centrífugo. El sistema axial es el sistema VRF convencional, en el cual la unidad exterior expulsa aire a través de ventiladores axiales por lo que debe instalarse en azoteas.

El sistema centrífugo usa un ventilador centrífugo. Es más compacto y no requiere de grandes unidades exteriores en la azotea. A diferencia del sistema axial, éste si permite expulsar el aire por medio de rejillas por lo cual resulta idóneo para locales comerciales.

#### **1.4.2.1.1 Ventajas y desventajas del sistema VRF**

- Ahorro energético y gran eficiencia.
- Al regular el caudal de refrigerante necesario según la demanda, es un sistema de gran eficiencia energética.
- No son muy pesados y tienen un diseño modular.
- Permite controlar cada área climatizada individualmente.
- Permiten la instalación de distintos tipos de unidades interiores que se adapten a las necesidades de cada zona del edificio.
- Permite programar la temperatura deseada en cada unidad interior.
- Bajos niveles sonoros.
- Es recomendable para oficinas, hoteles, hospitales, centros comerciales, etc.
- Permiten grandes distancias entre unidades exteriores e interiores y entre unidades interiores.

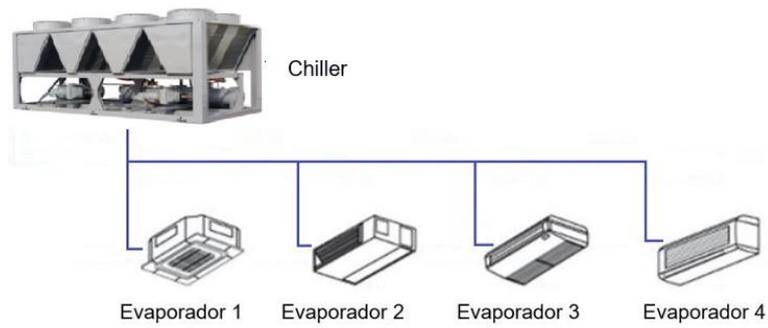

Pese a sus beneficios, existe una desventaja relacionada con el gas refrigerante. Aunque el gas refrigerante utilizado en estos sistemas no

es en realidad tóxico, en caso de una fuga, podría desplazar el aire de una habitación e inundarla con gas, haciendo que no haya oxígeno para respirar. Otra desventaja podría llegar a ser un elevado coste inicial de los aparatos y de la instalación auxiliar, en especial si se instala un sistema de 3 tubos. Por eso se debe asegurar que la rentabilidad energética compense la inversión inicial de instalación.

#### **1.4.2.2 Aire acondicionado tipo Chiller enfriado por agua**

Un chiller es un equipo que se encarga de enfriar un medio líquido, generalmente agua. El agua enfriada funciona como refrigerante intermedio y es enviada a las distintas unidades interiores. Estos sistemas son generalmente usados para climatizar instalaciones grandes debido a que permiten enfriar o calentar, según se requiera. Son útiles tanto para aplicaciones de aire acondicionado como en otros procesos de enfriamiento en la industria, incluso es capaz de satisfacer necesidades de agua caliente sanitaria (ACS). Este sistema calienta o enfría agua haciendo circular agua a través de un intercambiador de calor. La figura 1.4 muestra un esquema básico de la distribución de un sistema chiller enfriado por agua. El flujo de agua intercambia calor con el flujo de refrigerante, el cual se mantiene constantemente circulando para cumplir con el ciclo de refrigeración.

El chiller se coloca en el exterior del edificio y en el interior se colocan las unidades terminales o evaporadoras, las cuales cuentan con un serpentín por el cual circula el agua fría, y gracias a un ventilador, se hace recircular el aire del ambiente de la habitación. Estos sistemas se regulan a través de termostatos en cada ambiente individualmente, lo que da independencia a cada habitación del resto del edificio.

**Figura 1.4 Esquema básico de un sistema Chiller**  
Fuente: Elaboración propia

#### 1.4.2.2.1 Ventajas de un sistema tipo Chiller

- Permite llevar agua fría o caliente por las tuberías, a cualquier distancia y sin ocupar demasiado espacio dentro del inmueble.
- Permiten cubrir necesidades de aire acondicionado en grandes instalaciones como hoteles, edificios comerciales, hospitales, etc.
- Permite acumular agua fría en tanques, para asegurar tener la capacidad requerida en momentos de mayor demanda.
- Permite identificar fácilmente posibles fugas de agua, a diferencia de otros sistemas en los cuales identificar la fuga de refrigerante podría llegar a ser algo complejo.
- En caso de utilizarse como sistema de calefacción, se puede calentar el agua con la combustión de gas, lo cual resulta más barato.

# CAPÍTULO 2

## 2. METODOLOGÍA

### 2.1 Información general del edificio “The Garden Plaza Hotel”

El edificio “The Garden Plaza Hotel” es un edificio de hotelería y locales comerciales que será construido en el cantón Daule. El edificio contará con las siguientes áreas:

En la planta baja estarán ubicados los locales comerciales, el cuarto del generador eléctrico, la sala de recepción y una zona de estancia. En la primera planta se ubicarán también locales comerciales, la oficina de administración y una sala de espera. En la segunda, tercera, cuarta y quinta planta se encontrarán las habitaciones y sala de espera. Finalmente, en la terraza estarán ubicados espacios comunes como: área de mesas al aire libre, área de mesas climatizada, comedor, gimnasio, entre otros.

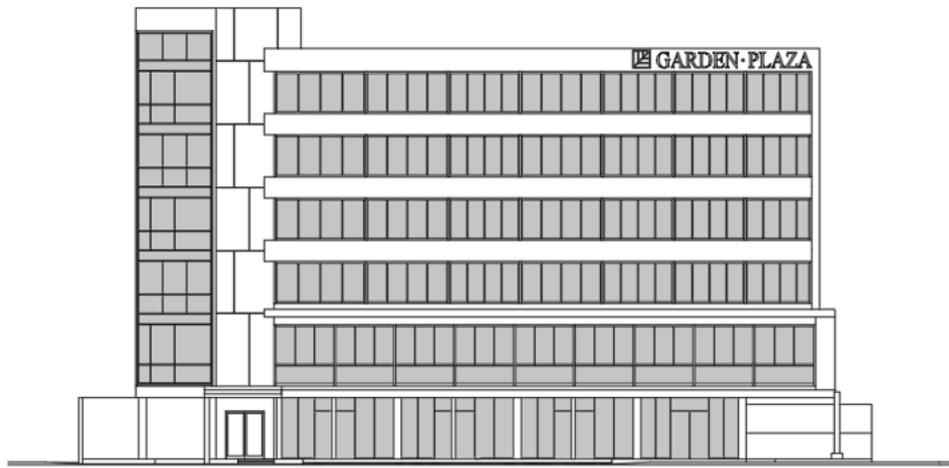

Figura 2.1 Ilustración de la fachada del edificio  
Fuente: Elaboración propia

### 2.2 Condiciones interiores y exteriores de diseño del edificio

Se ha considerado como condiciones interiores de diseño las establecidas por la normativa ASHRAE para el confort. Se definió 23°C de temperatura de bulbo seco y una humedad relativa de 50% para todas las áreas de interiores del edificio.

Por otro lado, las condiciones exteriores de diseño se tomaron en base a estadísticas de anuarios meteorológicos obtenidos del INAMHI. Para el cálculo de las cargas térmicas se tomaron los valores exteriores críticos para evitar que el sistema no pueda suplir la demanda cuando se den condiciones exteriores críticas.

En la tabla 2.1 se muestra los valores estadísticos de temperatura de bulbo seco y humedad relativa para la estación meteorológica M1207 ubicada en Nobol cerca de Daule.

**Tabla 2.1 Estadística de las condiciones exteriores de la estación M1207**

| Mes               | Temperatura de bulbo seco [°C] |       | Humedad Relativa (%) |

Fuente: INAMHI

Las condiciones exteriores críticas son:

Temperatura de bulbo seco: 33°C / 91.4°F

Humedad relativa: 90%

### 2.3 Cálculo de cargas térmicas de enfriamiento

La carga térmica de enfriamiento es la cantidad de calor que se debe extraer del aire de un interior para mantener una temperatura constante. Para lograr esto es vital estimar la transmisión de calor hacia dicho espacio por parte de diferentes fuentes como: personas, radiación solar, conducción a través de paredes, techo y vidrios al exterior, conducción a través de divisiones internas, cielos rasos y pisos, convección, alumbrado, equipos e infiltración. (Pita, 2002)

### 2.3.1 Carga térmica por conducción a través de la estructura exterior

La ganancia de calor por conducción a través de paredes, techo y vidrios se calculó mediante la ecuación 2.1.

$$Q_{cond} = U \cdot A \cdot DTCE_e \quad (2.1)$$

Donde

$Q_{cond}$ : ganancia de calor por conducción,  $BTU/h$

$U$ : coeficiente global de transferencia de calor,  $BTU/h \cdot ft^2 \cdot ^\circ F$

$A$ : área de transferencia de calor,  $ft^2$

$DTCE_e$ : diferencia de temperatura para carga de enfriamiento corregido,  $^\circ F$

La diferencia de temperatura para carga de enfriamiento toma en cuenta el efecto almacenamiento de calor. Este valor calcula con la ecuación 2.2.

$$DTCE_e = [(DTCE + LM) \cdot K + (78 - t_R) + (t_0 - 85)] \cdot f \quad (2.2)$$

Donde

$DTCE$ : diferencias de temperatura para carga de enfriamiento,  $^\circ F$

$LM$ : factor de corrección para latitud, color y mes,  $^\circ F$

$K$ : corrección por color de la superficie;  $K = 1$  para superficies oscuras o áreas industriales,  $K = 0.5$  para techos de color claro en zonas rurales,  $K = 0.65$  para paredes de color claro en zonas rurales.

$t_R$ : temperatura interior del edificio,  $^\circ F$

$t_0$ : temperatura de diseño exterior promedio,  $^\circ F$

$f$ : corrección para ventilación del cielo raso (sólo techos);  $f = 0.75$  para entrepiso,  $f = 1$  para demás casos.

Las tablas 2.2, 2.3 y 2.4 muestran los materiales de los cuales estará conformada la estructura exterior del edificio. Esta información se puede mostrar en la sección de apéndices.

**Tabla 2.2 Propiedades del material del techo**

| Descripción                                    | Peso<br>[lb/ft <sup>2</sup> ] | U<br>[BTU/h - ft <sup>2</sup> - °F] | DTCE<br>[°F] |

Fuente: Pita, 2002

Los valores DTCE para las paredes se muestran en la tabla 2.5, se obtuvieron considerando la orientación de las paredes. En este caso, el edificio tiene una pared dirigida hacia el norte, otra hacia el sur, y dos dirigidas hacia el este y oeste.

**Tabla 2.5 Valores DTCE para las paredes de acuerdo con su orientación**

| Orientación | DTCE<br>[°F] |
|-------------|--------------|
| Norte       | 24           |
| Sur         | 39           |
| Oeste       | 60           |
| Este        | 45           |

Fuente: Pita, 2002

La tabla 2.6 muestra los valores de los factores de corrección *LM* para paredes y techo. Estos valores también están dados por la orientación de las paredes y fueron tomados para el mes de abril que es el mes más caluroso.

**Tabla 2.6 Factor de corrección LM para paredes y techo**

| Latitud | Mes   | N | S  | E  | O  | Hora |
|---------|-------|---|----|----|----|------|
| 0       | Abril | 5 | -8 | -2 | -2 | -2   |

Fuente: Pita, 2002

Para obtener la carga térmica debido a las paredes, se determinó el área de cada una de ellas para luego utilizar la ecuación 2.2 con un valor de  $K = 0.65$ , y luego la ecuación 2.1 con un valor  $U$  de  $0.263 \text{ BTU}/h - ft^2 - ^\circ F$ . Para el techo se usó  $K = 0.5$  y su respectivo valor de  $U$ .

La tabla 2.7 muestra los resultados del cálculo de carga térmica por conducción en paredes exteriores y en el techo.

**Tabla 2.7 Carga térmica por conducción a través de paredes y techo**

| Estructura   | Área [ $ft^2$ ] | DTCE [ $^\circ F$ ] | LM [ $^\circ F$ ] | $DTCE_e$ [ $^\circ F$ ] | Q [ $Btu/h$ ]    |
|--------------|-----------------|---------------------|-------------------|-------------------------|------------------|
| Pared Norte  | 2,070.077       | 24                  | 5                 | 29.85                   | 16,251.24        |
| Pared Sur    | 1,982.953       | 39                  | -8                | 31.15                   | 16,245.25        |
| Pared Este   | 2,221.817       | 45                  | -2                | 38.95                   | 22,759.96        |
| Pared Oeste  | 2,052.954       | 60                  | -2                | 48.70                   | 26,294.44        |
| Techo        | 2,656.186       | 54                  | -2                | 37.00                   | 10,712.40        |
| <b>TOTAL</b> |                 |                     |                   |                         | <b>92,263.28</b> |

Elaboración propia

De igual manera se realizó el cálculo de la carga térmica por conducción a través de los vidrios de todo el edificio, ya que gran parte de la estructura exterior corresponde a este material. Se empleó la ecuación 2.1 para hallar el calor entrante, pero para hallar el valor  $DTCE_e$  se usó la ecuación 2.3 similar a la 2.2.

$$DTCE_e = DTCE + (78 - t_R) + (t_0 - 85) \quad (2.3)$$

Para los vidrios el valor de la  $DTCE$  es  $14^\circ F$ . La tabla 2.8 muestra el resultado del cálculo de carga térmica por conducción a través de vidrios.

**Tabla 2.8 Carga térmica por conducción a través de vidrios**

| Vidrios         | Área [ $ft^2$ ] | Q [ $Btu/h$ ]     |
|-----------------|-----------------|-------------------|
| Norte           | 3984.69         | 60,766.58         |
| Sur             | 2387.85         | 36,414.67         |
| Este            | 362.95          | 5,535.03          |
| Oeste           | 663.87          | 10,124.08         |
| Salas de espera | 1176.01         | 17,934.13         |
| <b>TOTAL</b>    |                 | <b>130,774.49</b> |

Elaboración propia

El resultado entonces de la carga térmica dada por conducción a través de la estructura exterior fue de 223,037.77  $Btu/h$ , es decir 19 toneladas de refrigeración.

### 2.3.2 Carga térmica por radiación solar a través de vidrios

Parte de la energía de la radiación solar es capaz de atravesar el vidrio por lo que constituye una ganancia de calor en el interior. Esta ganancia de calor varía de acuerdo con la hora, orientación, el sombreado y el efecto de almacenamiento. La ecuación 2.4 describe la ganancia de calor por radiación.

$$Q_{rad} = FGCS \cdot A \cdot CS \cdot FCE \quad (2.4)$$

Donde

$Q_{rad}$ : ganancia de calor por radiación solar,  $BTU/h$

$FGCS$ : factor de ganancia máxima de calor solar,  $BTU/h - ft^2$

$A$ : área del vidrio,  $ft^2$

$CS$ : coeficiente de sombreado

$FCE$ : factor de carga de enfriamiento para el vidrio

Los valores de  $FGCS$ ,  $CS$  y  $FCE$  están tabulados, mientras que el área del vidrio es la parte que recibe la radiación directa del sol.

Los valores del factor  $FGCS$  se tomaron considerando la latitud 0 y el mes de mayor temperatura exterior que es abril. Estos datos se muestran en la tabla 2.9.

**Tabla 2.9 Valores de FGCS para las ventanas**

| Mes   | Orientación |    |     |     |
|-------|-------------|----|-----|-----|
|       | N           | S  | E   | O   |
| Abril | 71          | 37 | 221 | 221 |

Fuente: Pita, 2002

El valor del coeficiente de sombreado CS se obtuvo para vidrio doble afuera y dentro. En la tabla 2.10 se muestran los coeficientes para ventanas con persianas venecianas.

**Tabla 2.10 Valores de CS para las ventanas**

| Tipo de vidrio                   | Tipo de sombreado interior |       |
|----------------------------------|----------------------------|-------|
|                                  | Persianas venecianas       |       |
|                                  | Medio                      | Claro |
| Doble claro afuera claro adentro | 0.57                       | 0.51  |

Fuente: Pita, 2002

Los valores seleccionados de los FCE se muestran en la tabla 2.11. Para escoger estos valores se debe considerar la orientación de la ventana, la hora del día y el tipo de construcción del edificio, que puede ser ligera, media y pesada. Se seleccionó construcción media.

**Tabla 2.11 Valores de FCE para las ventanas**

| Ventana viendo hacia | FCE  |
|----------------------|------|
| Norte                | 0.91 |
| Sur                  | 0.83 |
| Este                 | 0.80 |
| Oeste                | 0.82 |

Fuente: Pita, 2002

Con estos datos y el área de los vidrios se halló la carga térmica por radiación a través de vidrios. La tabla 2.12 muestra el resultado del cálculo.

**Tabla 2.12 Carga térmica por radiación a través de vidrios**

| Orientación  | Área [ $ft^2$ ] | Q [ $Btu/h$ ]     |
|--------------|-----------------|-------------------|
| Norte        | 4768.70         | 175,620.23        |
| Sur          | 2387.85         | 41,798.55         |
| Este         | 754.96          | 76,081.41         |
| Oeste        | 663.87          | 68,575.15         |
| <b>TOTAL</b> |                 | <b>362,075.33</b> |

Elaboración propia

Entonces la carga térmica por radiación a través de vidrios es 362,075.33 *Btu/h*, es decir 30.2 toneladas de refrigeración.

### 2.3.3 Carga térmica por iluminación

La iluminación es la principal fuente de carga térmica en el interior del edificio, por lo que es importante estimar con la mayor exactitud posible su emisión de calor. La tasa instantánea de ganancia de calor por iluminación se puede calcular a partir de la ecuación 2.5.

$$Q_{el} = W \cdot F_{ul} \cdot F_{sa} \quad (2.5)$$

Donde

$Q_{el}$ : ganancia de calor, *BTU/h*

$W$ : potencia total de iluminación instalada, *BTU/h*

$F_{ul}$ : factor de uso

$F_{sa}$ : factor especial de tolerancia

Dado que no se cuenta con los planos de iluminación definitivos, las normas ASHRAE permiten calcular la ganancia de calor por iluminación por metro cuadrado.

En la tabla 2.13 se muestra los valores de las LPD (densidades de potencia de iluminación) para cada área del edificio.

**Tabla 2.13 Valores LPD para las diferentes áreas del edificio**

| Espacio             | LPD<br>[ <i>W/m<sup>2</sup></i> ] |
|---------------------|-----------------------------------|
| Hall                | 8.10                              |
| Locales comerciales | 18.10                             |
| Administración      | 11.90                             |
| Sala de espera      | 11.40                             |
| Habitaciones        | 11.90                             |
| Sala de eventos     | 14.10                             |
| Gimnasio            | 7.80                              |
| Sala de juntas      | 11.90                             |
| Presidencia         | 11.90                             |

Fuente: Spittler, 2014

Con estos datos y el área de cada espacio climatizado se calculó la potencia total de iluminación para el edificio.

**Tabla 2.14 Carga térmica por iluminación**

| Espacio             | LPD<br>[W/m <sup>2</sup> ] | Área [m <sup>2</sup> ] | Q [W]            |
|---------------------|----------------------------|------------------------|------------------|
| Hall                | 8.10                       | 504.34                 | 4,085.15         |
| Locales comerciales | 18.10                      | 533.17                 | 9,650.38         |
| Administración      | 11.90                      | 20.71                  | 246.45           |
| Sala de espera      | 11.40                      | 79.35                  | 904.59           |
| Habitaciones        | 11.90                      | 1,322.03               | 15,732.16        |
| Sala de eventos     | 14.10                      | 86.03                  | 1,213.02         |
| Gimnasio            | 7.80                       | 24.87                  | 193.99           |
| Sala de juntas      | 11.90                      | 12.69                  | 151.01           |
| Presidencia         | 11.90                      | 8.34                   | 99.25            |
| <b>TOTAL</b>        |                            |                        | <b>32,275.99</b> |

Elaboración propia

La tabla 2.14 muestra que la carga térmica por iluminación obtenida fue de 32,276 W lo que equivale a 9.2 toneladas de refrigeración.

### 2.3.4 Carga térmica por personas

La emisión de calor de las personas en un espacio tiene 2 componentes, el sensible y el latente. Esta emisión de calor depende de la actividad que realicen las personas, a mayor nivel de actividad, mayor emisión de calor. En la tabla 2.15 se muestra algunos valores de calor generado por personas para diferentes actividades.

**Tabla 2.15 Valores representativos de ganancia de calor por actividad de personas**

| Nivel de actividad                     | Ubicación                        | Calor total [W] |
|--|----------------------------------|-----------------|
| De pie, trabajo liviano, caminar       | Almacenes y tiendas              | 160             |
| Actividad moderada, trabajo de oficina | Oficinas, hoteles, departamentos | 140             |
| Sentado, actividad muy baja            | Oficinas, hoteles, departamentos | 130             |
| Baile moderado                         | Sala de baile                    | 265             |
| Ejercicios                             | Gimnasio                         | 585             |

Fuente: Spittler, 2014

La tabla 2.16 muestra el resultado del cálculo de carga térmica por personas.

**Tabla 2.16 Carga térmica por actividad de personas**

| Espacio         | Nivel de actividad                     | Calor por persona [W] | Número de personas | Calor total [W] |
|-----------------|--|-----------------------|--------------------|-----------------|
| Locales         | De pie, trabajo liviano, caminar       | 160                   | 123                | 19,680          |
| Administración  | Actividad moderada, trabajo de oficina | 140                   | 3                  | 420             |
| Sala de espera  | Sentado, actividad muy baja            | 130                   | 12                 | 1,560           |
| Habitaciones    | Sentado, actividad muy baja            | 130                   | 118                | 15,340          |
| Sala de eventos | Baile moderado                         | 265                   | 22                 | 5,830           |
| Gimnasio        | Ejercicios                             | 585                   | 10                 | 5,850           |
| Sala de juntas  | Actividad moderada, trabajo de oficina | 140                   | 4                  | 560             |
| <b>TOTAL</b>    |  |                       |                    | <b>49,240</b>   |

Elaboración propia

La carga térmica por personas obtenida fue de 49,240 W lo que equivale a 14.13 toneladas de refrigeración. Cabe recalcar que esta carga se daría en el caso de que el edificio se encuentre a tope de capacidad.

### 2.3.5 Carga térmica por equipos

Es posible calcular la ganancia de calor por equipos de manera directa. Los equipos que influyen en la ganancia de calor serán principalmente: computadoras que serán usadas en los locales comerciales, salas de administración y presidencia; también minibares que funcionarán en las habitaciones. La tabla 2.17 muestra el resultado del cálculo de carga térmica por equipos.

**Tabla 2.17 Carga Térmica por equipos**

| Equipo       | Carga Térmica [W] | Cantidad | Carga Total [W] | Carga Total [Btu/h] |
|--------------|-------------------|----------|-----------------|---------------------|
| Computadora  | 200               | 18       | 3,600           | 12,290.85           |
| Minibar      | 125               | 59       | 7,375           | 25,179.23           |
| Televisor    | 100               | 59       | 5,900           | 20,143.40           |
| <b>TOTAL</b> |                   |          |                 | <b>57,613.48</b>    |

Elaboración propia

La carga total por equipos es de 57,613.48 Btu/h lo que equivale a 4.80 toneladas de refrigeración.

## 2.4 Diseño del sistema de climatización

### 2.4.1 Alternativas de diseño

Para lograr climatizar un edificio se puede hacer uso de diferentes tipos de sistemas de climatización. La selección del sistema de climatización del edificio depende de varios aspectos, como la ubicación del edificio, el clima, la actividad que se desarrollará en el edificio, entre otros. Para nuestro caso, se siguió los procedimientos de las normas ASHRAE, con el fin de garantizar el confort de los usuarios.

Se realizó la matriz de decisión para seleccionar la opción más conveniente para realizar el diseño. Se consideraron como alternativas de solución las siguientes:

- Sistema de volumen de refrigerante variable (VRF)
- Sistema tipo Chiller enfriado por agua
- Sistema de expansión directa (centrales y splits)

### 2.4.2 Selección de la mejor alternativa de diseño

Una vez se ha investigado sobre los sistemas propuestos, se elaboró la **matriz de decisión** para seleccionar el sistema que sería utilizado para la climatización del edificio. La tabla 2.18 muestra el sistema de calificación para la elaboración de la matriz de decisión.

**Tabla 2.18 Sistema de calificación para la matriz de decisión**

|                  |   |
|------------------|---|
| <b>Excelente</b> | 4 |
| <b>Muy bueno</b> | 3 |
| <b>Apropiado</b> | 2 |
| <b>Bajo</b>      | 1 |
| <b>No cumple</b> | 0 |

Elaboración propia

Los criterios utilizados para la calificación de las alternativas en la matriz de decisión fueron los siguientes:

**Costo de instalación:** Inversión que se debe realizar para el diseño, adquisición e instalación de los equipos del sistema.

**Eficiencia y consumo eléctrico:** Energía necesaria para el funcionamiento del sistema. Se requiere el sistema que tenga el menor consumo de energía posible para cumplir con los requerimientos.

**Espacio:** Espacio necesario para instalar los equipos necesarios para el funcionamiento correcto del sistema.

**Costo de mantenimiento y reparaciones:** Costo de actividades de mantenimiento y reparación de los equipos.

**Ruido:** Nivel de contaminación auditiva proporcionada por el sistema.

Una vez definidos los criterios más importantes para el diseño del sistema, se asignó un peso de ponderación a cada uno de ellos para elaborar la matriz de decisión mostrada en la tabla 2.19.

El costo de instalación es alto para el sistema VRF debido a dos razones principales: la primera es que los equipos son costosos ya que poseen una tecnología más sofisticada, la segunda es que se requiere una mano de obra calificada para la instalación. Además, requiere largos recorridos de cañería de cobre lo que aumenta el costo considerablemente. El sistema de agua helada (Chiller), requiere una instalación más sencilla y menos costosa ya que las tuberías por donde circula el agua son de acero, aisladas con poliestireno lo cual disminuye el costo de instalación de una manera significativa, a pesar de tener que implementar bombas para poder distribuir el agua por todo el sistema. Un factor muy importante para considerar es el consumo eléctrico. Debido a que el Ecuador es un país productor de energía eléctrica es factible implementar estos sistemas considerando que el costo de dicha energía es relativamente bajo en comparación con otros países. El sistema VRF al tener compresores inverter permite optimizar el consumo de energía de los equipos, además de no requerir ningún tipo de equipos auxiliares como bombas.

El espacio en edificaciones es un aspecto muy importante ya que existen otro tipo de instalaciones que requieren de espacio para llevarse a cabo, debido a esto es que a medida que nuestro sistema ocupe menos espacio

será una ventaja, el chiller cuenta con unas dimensiones considerables las cuales hacen que el uso del espacio no sea optimo, más aún si se llegase a necesitar una torre de enfriamiento, por lo que es un punto débil de este sistema. Tanto los splits de expansión directa, así como el sistema VRF optimiza de manera perfecta el espacio.

En cuanto a costos de mantenimiento y reparación los splits de expansión directa presentan una ventaja con respecto al VRF y Chiller ya que no requieren de una mano de obra especializada, así como los repuestos son más económicos.

Finalmente, la contaminación auditiva es un aspecto importante en este tipo de obras ya que afecta al confort de los usuarios. El sistema VRF al ser de tipo inverter presentan unos compresores silenciosos, lo que lo vuelve la mejor opción en este apartado, ya que los otros dos sistemas son más ruidosos ya que presentan compresores comunes, así como bombas en el caso de los Chiller.

**Tabla 2.19 Matriz de decisión**

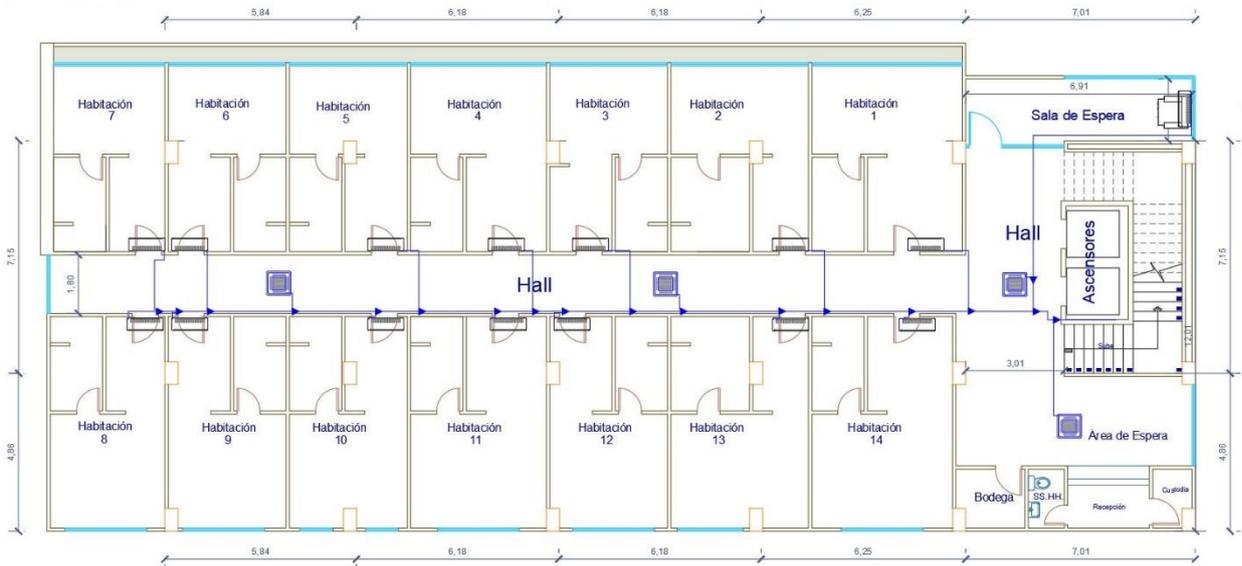

| Criterios                             | Peso | VRF         | CHILLER     | EXPANSIÓN DIRECTA (SPLITS Y CENTRALES) |
|---------------------------------------|------|-------------|-------------|--|
| Costo de instalación                  | 0.25 | 1           | 3           | 3                                      |
| Eficiencia o consumo eléctrico        | 0.25 | 4           | 3           | 1                                      |
| Espacio                               | 0.20 | 4           | 2           | 2                                      |
| Costo de mantenimiento y reparaciones | 0.20 | 1           | 2           | 3                                      |
| Ruido                                 | 0.10 | 4           | 2           | 3                                      |
| <b>TOTAL</b>                          |      | <b>2.65</b> | <b>2.50</b> | <b>2.30</b>                            |

Elaboración propia

De acuerdo con la matriz de decisión la alternativa ganadora es el sistema VRF.

### 2.4.3 Diseño de forma del sistema de climatización

El sistema de climatización VRF dispone de manera general de unidades exteriores en las cuales ocurre la condensación del refrigerante, que es luego enviado a las unidades interiores o evaporadores. Las unidades condensadoras serán ubicadas en la terraza del edificio y se conectarán con las unidades interiores mediante tubería de cobre. En la figura 2.2 se muestra una vista superior del segundo piso del edificio en la cual se observa la ubicación de las unidades evaporadoras, así como la distribución de las tuberías que conducen el refrigerante. En la figura 2.3 se observa la vista de planta de la terraza, en ella se observa la ubicación de las unidades condensadoras.

# CAPÍTULO 3

## 3. RESULTADOS Y ANÁLISIS

De acuerdo con el análisis de cargas térmicas realizado en el capítulo 2, se obtuvo que la carga térmica total del edificio es que 80 toneladas de refrigeración. Se consideró un factor de seguridad de 1.2 para la capacidad que se requiere instalar en el edificio, lo que da como resultado final 96 toneladas de refrigeración. Con esta información se procedió a la selección de los equipos del sistema.

### 3.1 Selección de equipos del sistema de climatización

Para la selección de los equipos se usó el programa Global VRF de Johnson Controls, en el cual se estimó también la carga térmica del edificio completo arrojando un valor aproximado de 100 toneladas de refrigeración necesarios para climatizar el lugar. Los resultados obtenidos de la simulación con el programa se encuentran en la sección de apéndices.

#### 3.1.1 Planta baja

En la tabla 3.1 se encuentra el detalle de los equipos que serán instalados en la planta baja del edificio. La distribución de este piso será diferente las demás ya en éste se ubican los locales comerciales. Además, los recorridos de cañería serán los más largos debido a la distancia que existe entre la planta de terraza de equipos hasta este piso, lo que implica más materiales de instalación.

**Tabla 3.1 Equipos Planta Baja**

| Ítem | Unid. | Modelo         | Descripción   | Btu/h   |
|------|-------|----------------|---|---------|
| 1    | 1     | JTOH220VPERBS1 | Unidad Exterior VRF Modular tipo Bomba de Calor, de 22 HP Térmicos de Capacidad Nominal, que opera a 220V / 3Ph / 60Hz. | 210,302 |
| 2    | 1     | JTKF112H0PSAQ  | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 38,200 Btus. Incluye panel.    | 38,200  |
| 3    | 7     | JTKF056H0PSAQ  | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 19,100 Btus. Incluye panel.    | 19,100  |

| Ítem | Unid. | Modelo     | Descripción  | Btu/h |
|------|-------|------------|--|-------|
| 4    | 3     | MW-NP902A3 | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410A, rango de capacidad de 248,300 - 534,700 Btus. | 0     |
| 5    | 4     | MW-NP692A3 | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410A, rango de capacidad de 171,900 - 248,200 Btus. | 0     |

Elaboración propia

Se dispondrá de una unidad condensadora de potencia nominal de 22 HP con capacidad de 210,302 Btu/h de enfriamiento para la refrigeración de este piso. Las unidades terminales serán de tipo Cassette de 4 vías distribuidas entre los locales.

### 3.1.2 Primer piso

La tabla 3.2 muestra los equipos que se instalarán en el primer piso. Al igual que la planta baja, la distribución no será tan complicada en cuanto a recorrido de cañería ya que son locales comerciales, además en este piso se presenta un corredor el cual estará climatizado también, por lo que se tendrá pequeñas diferencias con la planta baja.

**Tabla 3.2 Equipos Primer Piso**

| Ítem | Unid. | Modelo         | Descripción   | Btu/h   |
|------|-------|----------------|---|---------|
| 1    | 1     | JTOH220VPERBS1 | Unidad Exterior VRF Modular tipo Bomba de Calor, de 22 HP Térmicos de Capacidad Nominal, que opera a 220V / 3Ph / 60Hz. | 210,302 |
| 2    | 2     | JTHW036H0NB0AQ | Unidad Interior tipo High Wall para Sistemas VRF York, con Capacidad Nominal de 12,300 Btus                             | 12,300  |
| 3    | 4     | JTKF112H0PSAQ  | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 38,200 Btus. Incluye panel.    | 38,200  |

| Ítem | Unid. | Modelo        | Descripción   | Btu/h  |
|------|-------|---------------|---|--------|
| 4    | 6     | JTKF056H0PSAQ | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 19,100 Btus. Incluye panel.  | 19,100 |
| 5    | 3     | JCWA10NEGQ    | Control Remoto Alámbrico pantalla táctil marca YORK, para controlar una zona con hasta 16 evaporadores simultáneamente.   | 0      |
| 6    | 4     | MW-NP902A3    | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410 <sup>a</sup> , rango de capacidad de 248,300 – 534,700 Btus. | 0      |
| 7    | 7     | MW-NP452A3    | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410 <sup>a</sup> , rango de capacidad de 114,600 – 171,800 Btus. | 0      |

Elaboración propia

Como el caso de la planta baja, para este piso también se dispondrá de una unidad condensadora igual a la anterior y también unidades tipo Cassette con sus respectivas capacidades de enfriamiento. Además, se tendrá una unidad de pared correspondiente a la sala de administración.

### 3.1.3 Segundo piso

La tabla 3.3 muestra los equipos que serán requeridos para el segundo piso. A diferencia de las plantas modelos, este tipo consta con suite un poco más grandes por lo que habrá un ligero cambio en las cargas térmicas y en selección de capacidad de equipos, la distribución de cañería de cobre será más detallada con respecto a la de pisos anteriores ya que es la primera planta de habitaciones.

**Tabla 3.3 Equipos Segundo Piso**

| Ítem | Unid. | Modelo         | Descripción   | Btu/h   |
|------|-------|----------------|---|---------|
| 1    | 1     | JTOH240VPERBS1 | Unidad Exterior VRF Modular tipo Bomba de Calor, de 24 HP Térmicos de Capacidad Nominal, que opera a 220V / 3Ph / 60Hz. | 229,421 |

| Ítem | Unid. | Modelo         | Descripción   | Btu/h  |
|------|-------|----------------|---|--------|
| 2    | 4     | JTKF040H0PSAQ  | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 13,600 Btus. Incluye panel.  | 13,600 |
| 3    | 13    | JTHW036H0NB0AQ | Unidad Interior tipo High Wall para Sistemas VRF York, con Capacidad Nominal de 12,300 Btus   | 12,300 |
| 4    | 2     | JTHW056H0NB0AQ | Unidad Interior tipo High Wall para Sistemas VRF York, con Capacidad Nominal de 19,100 Btus   | 19,100 |
| 5    | 2     | JCWA10NEGQ     | Control Remoto Alámbrico pantalla táctil marca YORK, para controlar una zona con hasta 16 evaporadores simultáneamente.   | 0      |
| 6    | 2     | MW-NP902A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410 <sup>a</sup> , rango de capacidad de 248,300 – 534,700 Btus. | 0      |
| 7    | 7     | MW-NP282A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410 <sup>a</sup> , rango de capacidad de 0 – 114,500 Btus.       | 0      |
| 8    | 4     | MW-NP692A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410 <sup>a</sup> , rango de capacidad de 171,900 – 248,200 Btus. | 0      |
| 9    | 5     | MW-NP452A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410 <sup>a</sup> , rango de capacidad de 114,600 – 171,800 Btus. | 0      |

Elaboración propia

Este piso será enfriado gracias a una unidad condensadora de 24 HP de potencia nominal con capacidad de 229,421 Btu/h de enfriamiento. En las habitaciones y sala de espera se tendrán unidades interiores de tipo pared, a diferencia de los pasillos que contarán con unidades tipo Cassette.

### 3.1.4 Tercer, cuarto y quinto piso

**Tabla 3.4 Equipos 3er, 4to y 5to Piso**

| Ítem | Unid. | Modelo         | Descripción   | Btu/h   |
|------|-------|----------------|---|---------|
| 1    | 1     | JTOH240VPERBS1 | Unidad Exterior VRF Modular tipo Bomba de Calor, de 24 HP Térmicos de Capacidad Nominal, que opera a 220V / 3Ph / 60Hz.   | 229,421 |
| 2    | 3     | JTKF040H0PSAQ  | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 13,600 Btus. Incluye panel.  | 13,600  |
| 3    | 13    | JTHW036H0NB0AQ | Unidad Interior tipo High Wall para Sistemas VRF York, con Capacidad Nominal de 12,300 Btus   | 12,300  |
| 4    | 3     | JTHW056H0NB0AQ | Unidad Interior tipo High Wall para Sistemas VRF York, con Capacidad Nominal de 19,100 Btus   | 19,100  |
| 5    | 2     | JCWA10NEGQ     | Control Remoto Alámbrico pantalla táctil marca YORK, para controlar una zona con hasta 16 evaporadores simultáneamente.   | 0       |
| 6    | 2     | MW-NP902A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410 <sup>a</sup> , rango de capacidad de 248,300 – 534,700 Btus. | 0       |
| 7    | 7     | MW-NP282A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410 <sup>a</sup> , rango de capacidad de 0 – 114,500 Btus.       | 0       |
| 8    | 4     | MW-NP692A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410 <sup>a</sup> , rango de capacidad de 171,900 – 248,200 Btus. | 0       |
| 9    | 5     | MW-NP452A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410 <sup>a</sup> , rango de capacidad de 114,600 – 171,800 Btus. | 0       |

Elaboración propia

Los equipos que se necesitan para el funcionamiento del sistema en las plantas 3, 4 y 5 se muestran en la tabla 3.4.

Al ser planta tipo su instalación será más simplificada ya que se necesitará los mismos equipos y materiales. Estos pisos también contarán cada uno con unidades exteriores de 24 HP similares a la del piso 2, así como unidades de pared y tipo Cassette ubicadas de igual forma a las del segundo piso.

### 3.1.5 Terraza

Los equipos que se necesitan en el último piso se muestran en la tabla 3-5. La distribución de los equipos debido a la cantidad de área al aire libre será una de las plantas más sencillas de instalar ya que hay pocas bifurcaciones, además de estar solo por debajo de la terraza de equipos sería la primera planta por instalar.

**Tabla 3-5 Equipos Terraza**

| Ítem | Unid. | Modelo         | Descripción   | Btu/h   |
|------|-------|----------------|---|---------|
| 1    | 1     | JTOH220VPERBS1 | Unidad Exterior VRF Modular tipo Bomba de Calor, de 22 HP Térmicos de Capacidad Nominal, que opera a 220V / 3Ph / 60Hz. | 210,302 |
| 2    | 3     | JTKF056H0PSAQ  | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 19,100 Btus. Incluye panel.    | 19,100  |

| 9    | 1     | MW-NP282A3 | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410A, rango de capacidad de 171,900 - 248,200 Btus. | 0     |
| 10   | 2     | MW-NP452A3 | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410A, rango de capacidad de 114,600 - 171,800 BTU.  | 0     |

Elaboración Propia

Para este último piso también se instalará una unidad condensadora de 22 HP y unidades interiores tipo Cassette para pasillos, gimnasio, sala de juntas y área climatizada de mesas. En la oficina de presidencia y en la sala de espera se colocarán unidades tipo pared.

Los planos de distribución del sistema de climatización se encuentran en el apéndice D, en la sección de apéndices.

### 3.2 Selección de tubería y materiales

El sistema de tuberías del sistema de climatización está compuesto por tubos de cobre de diferentes diámetros en diferentes tramos. Esto se debe a que se debe conservar el caudal de refrigerante que se distribuye a cada unidad terminal del sistema de climatización. Para obtener los metros de tubería se utilizaron los planos de la distribución de cañerías para cada piso. Estos planos se muestran en la sección de apéndices. La tabla 3.6 muestra el detalle de la tubería necesaria para cada piso del edificio.

**Tabla 3.6 Metros de tubería de cobre necesarios**

| <b>Metros de tubería para cada diámetro</b> |               |               |               |               |              |               |              |                 |               |
|---|---------------|---------------|---------------|---------------|--------------|---------------|--------------|-----------------|---------------|
| <b>PISO</b>                                 | <b>¼ in</b>   | <b>3/8 in</b> | <b>½ in</b>   | <b>5/8 in</b> | <b>¾ in</b>  | <b>7/8 in</b> | <b>1 in</b>  | <b>1 1/8 in</b> | <b>1 ¼ in</b> |
| Planta baja                                 | 5.04          | 5.25          | 8.15          | 14.61         | 10.35        | 0.00          | 3.11         | 9.36            | 10.35         |
| Piso 1                                      | 35.40         | 28.86         | 44.70         | 28.10         | 2.79         | 6.82          | 9.29         | 6.06            | 2.79          |
| Piso 2                                      | 26.15         | 15.19         | 30.31         | 20.56         | 8.66         | 3.65          | 4.13         | 14.90           | 2.78          |

Elaboración propia

### 3.3 Costos de inversión

A continuación, se muestran los costos tanto de equipos, materiales y mano de obra para la instalación del sistema de climatización.

#### 3.3.1 Equipos del Sistema VRF

En la tabla 3.8 se muestra el detalle de los costos para los equipos del sistema de climatización.

**Tabla 3.8 Costos de Equipos Sistema VRF**

| <b>Ítem</b> | <b>Unid.</b> | <b>Modelo</b>  | <b>Descripción</b>   | <b>Precio Unitario</b> | <b>Precio Total</b> |
|-------------|--------------|----------------|--|------------------------|---------------------|
| 1           | 4            | JTOH240VPERBS1 | Unidad Exterior VRF Modular tipo Bomba de Calor, de 24 HP Térmicos de Capacidad Nominal, que opera a 220V / 3Ph / 60Hz.  | 11,394.12              | \$45,576.48         |
| 2           | 13           | JTKF040H0PSAQ  | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 13,600 Btus. Incluye panel.   | 534.2                  | \$6,944.60          |
| 3           | 54           | JTHW036H0NB0AQ | Unidad Interior tipo High Wall para Sistemas VRF York, con Capacidad Nominal de 12,300 Btus  | 489.44                 | \$26,429.76         |
| 4           | 12           | JTHW056H0NB0AQ | Unidad Interior tipo High Wall para Sistemas VRF York, con Capacidad Nominal de 19,100 Btus  | 617.92                 | \$7,415.04          |
| 5           | 15           | JCWA10NEGQ     | Control Remoto Alámbrico pantalla táctil marca YORK, para controlar una zona con hasta 16 evaporadores simultáneamente.  | 58.26                  | \$873.90            |
| 6           | 15           | MW-NP902A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410A, rango de capacidad de 248,300 - 534,700 Btus. | 154.07                 | \$2,311.05          |
| 7           | 32           | MW-NP282A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410A, rango de capacidad de 0 - 114,500 Btus.       | 84.23                  | \$2,695.36          |
| 8           | 21           | MW-NP692A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410A, rango de capacidad de 171,900 - 248,200 Btus. | 133                    | \$2,793.00          |
| 9           | 24           | MW-NP452A3     | Juego de Branch (2 piezas) marca YORK, para interconexión de unidad interior en sistemas de 2 tubos VRF GEN II Bomba de Calor, para refrigerante R-410A, rango de capacidad de 114,600 - 171,800 Btus. | 117.48                 | \$2,819.52          |
| 10          | 3            | JTOH220VPERBS1 | Unidad Exterior VRF Modular tipo Bomba de Calor, de 22 HP Térmicos de Capacidad Nominal, que opera a 220V / 3Ph / 60Hz.  | 10,622.98              | \$31,868.94         |

| Ítem | Unid. | Modelo        | Descripción  | Precio Unitario | Precio Total        |
|------|-------|---------------|--|-----------------|---------------------|
| 11   | 16    | JTKF056H0PSAQ | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 19,100 Btus. Incluye panel.                           | 575.09          | \$9,201.44          |
| 12   | 6     | JTKF112H0PSAQ | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 38,200 Btus. Incluye panel.                           | 657.22          | \$3,943.32          |
| 13   | 2     | JTKF160H0PSAQ | Unidad Interior tipo Cassette de 4 Vías para Sistemas VRF York, con Capacidad Nominal de 54,600 Btus. Incluye panel.                           | 682.42          | \$1,364.84          |
| 14   | 1     | CMNETS        | Cloud Gateway para controlar hasta 160 unidades interiores o 64 unidades exteriores por medio de una aplicación en el teléfono móvil o Tablet. | 2,594.19        | \$2,594.19          |
|      |       |               |  | <b>Subtotal</b> | \$146,831.44        |
|      |       |               |  | <b>IVA 12%</b>  | \$17,619.77         |
|      |       |               |  | <b>Total</b>    | <b>\$164,451.21</b> |

Elaboración propia

**Tabla 3.9 Costos de materiales**

| Ítem | metros | Descripción               | Costo por metro | Costo Total       |
|------|--------|---------------------------|-----------------|-------------------|
| 1    | 192.8  | Tubo cobre Flex 1/4"x50   | 1.44            | \$277.59          |
| 2    | 93.74  | Tubo cobre Flex 3/8"x50   | 2.23            | \$209.04          |
| 3    | 242.1  | Tubo cobre Flex 1/2"x50   | 3.05            | \$738.31          |
| 4    | 133.4  | Tubo cobre Flex 5/8"x50   | 4.82            | \$643.13          |
| 5    | 42.08  | Tubo cobre Flex 3/4"x50   | 5.55            | \$233.54          |
| 6    | 44.11  | Tubo cobre Flex 7/8"x50   | 7.55            | \$333.03          |
| 7    | 49.26  | Tubo cobre Flex 1"x50     | 10.52           | \$518.22          |
| 8    | 113.7  | Tubo cobre Flex 1 1/8"x50 | 13.44           | \$1,527.86        |
| 9    | 72.87  | Tubo cobre Flex 1 1/4"x50 | 15.97           | \$1,163.73        |
| 10   | 192.8  | Aislante térmico 1/4"     | 0.29            | \$55.90           |
| 11   | 93.74  | Aislante térmico 3/8"     | 0.45            | \$42.18           |
| 12   | 242.1  | Aislante térmico 1/2"     | 0.61            | \$147.66          |
| 13   | 133.4  | Aislante térmico 5/8"     | 0.96            | \$128.09          |
| 14   | 42.08  | Aislante térmico 3/4"     | 1.13            | \$47.55           |
| 15   | 44.11  | Aislante térmico 7/8"     | 1.51            | \$66.61           |
| 16   | 49.26  | Aislante térmico 1"       | 2.1             | \$103.45          |
| 17   | 113.7  | Aislante térmico 1 1/8"   | 2.69            | \$305.80          |
| 18   | 72.87  | Aislante térmico 1 1/4"   | 3.19            | \$232.46          |
|      |        |                           | <b>Subtotal</b> | \$6,774.16        |
|      |        |                           | <b>IVA 12%</b>  | \$812.90          |
|      |        |                           | <b>Total</b>    | <b>\$7,587.06</b> |

Elaboración propia

En cuanto a los costos por materiales, la tabla 3.9 muestra esos valores. Adicional a los costos por equipos y materiales del sistema de climatización, se considera también el costo por mano de obra e instalación, así como el eventual alquiler de una plataforma y una pluma para la colocación y montaje de los equipos. Estos valores se muestran en la tabla 3.10.

**Tabla 3.10 Otros costos**

| Ítem         | Descripción   | Costo             |
|--------------|---|-------------------|
| 1            | Alquiler de plataforma y pluma para montaje de equipos en terraza.  | \$500             |
| 2            | Mano de obra: Incluye instalación e interconexión de unidades exteriores e interiores, así como suministro de materiales adicionales necesarios para la instalación de estos. | \$6500            |
| Subtotal     |   | \$7,000.00        |
| IVA 12%      |   | \$840.00          |
| <b>TOTAL</b> |   | <b>\$7,840.00</b> |

Elaboración propia

Al sumar todos estos valores ya mencionados nos da que el total de la inversión inicial para llevar a cabo el proyecto del sistema de climatización es de \$179,878.27.

### 3.4 Costos de consumo energético

Como podemos visualizar en la tabla 3.11, el sistema VRF con respecto a un sistema de expansión directa presenta un ahorro no tan apreciable a simple vista, podría darse a entender que no vale la pena la inversión ya que el ahorro en consumo energético no es suficiente, notamos que al mes podríamos llegar a ahorrar un valor de \$1526.43 considerando una operación de 12 horas diarias a cargas totales tanto en el sistema VRF como en el de expansión directa, sin embargo en un hotel los equipos acondicionadores de aire trabajan las 24 horas del día, esto hace que el sistema VRF se optimice, ya que en este tiempo los compresores inverter dejan de funcionar a máxima capacidad y trabajan solo a carga parcial, llegando muchas veces a trabajar un solo compresor de los 4 disponibles, y dicho compresor que opera tiene la capacidad de suministrar la demanda necesaria en cada uno de los pisos ya

que no todos los equipos ubicados en diferentes habitaciones trabajarían a la par. Adicionalmente la gran virtud de este sistema es que el flujo de refrigerante necesario para extraer el calor de un área específico es optimizado por el compresor dando así un desempeño óptimo por lo que no se exige en todo momento, sólo cuando es necesario. Por otro lado, los compresores de los equipos de expansión directa trabajan a su máxima potencia en todo momento ya que no poseen la tecnología de flujo variables que si presentan los inverter. Si extrapolamos este comportamiento a cada unidad inverter podemos llegar a ahorrar un 70% de energía con respecto a los sistemas convencionales.

**Tabla 3.11 Cálculo de Costos por energía eléctrica**

|                                 |                         |                           |
|---------------------------------|-------------------------|---------------------------|
| <b>Condensador VRF 22 hp</b>    | <b>PB 1P Terraza</b>    |                           |
|                                 | \$17.71                 | Diario                    |
|                                 | \$531.36                | Mensual                   |
| TOTAL                           | \$1,594.08              |                           |
| <b>Condensador VRF 24 hp</b>    | <b>2P 3P 4P 5P</b>      |                           |
|                                 | \$19.33                 | Diario                    |
|                                 | \$579.96                | Mensual                   |
| TOTAL                           | \$2,319.84              |                           |
| <b>TOTAL EDIFICIO</b>           |                         | \$3,913.92                |
| <b>Ahorro del 39%</b>           |                         | \$2,387.49                |
| <b>Costos expansión directa</b> | <b>Todo el edificio</b> |                           |
|                                 | \$18.98                 | Diario                    |
|                                 | \$569.27                | Mensual                   |
| TOTAL                           | \$3,984.88              |                           |
| <b>Ahorro Total</b>             |                         | <b>\$1,597.38 Mensual</b> |

Elaboración propia

**Tabla 3.12 Consumo de potencia para cada equipo**

| <b>Equipo</b>         | <b>Consumo (kW)</b> |
|-----------------------|---------------------|
| VRF condensadora 22hp | 16.40               |
| Expansión directa     | 17.57               |
| VRF condensadora 24hp | 17.90               |

Elaboración propia

Para estos cálculos se consideró un costo de \$0.09 por kWh.

# CAPÍTULO 4

## 4. CONCLUSIONES Y RECOMENDACIONES

### 4.1 Conclusiones

- Mediante el cálculo de carga térmica se pudo establecer varias alternativas de diseño los cuales fueron evaluados mediante una matriz de selección y se logró escoger el mejor diseño.
- Se logro cumplir los requisitos proporcionados por la empresa para la implementación del sistema.
- Se estableció un presupuesto accesible para poder implementar el sistema completo VRF en el hotel "THE GARDEN PLAZA".
- La versatilidad de este sistema permite seleccionar varios tipos de evaporadoras con una misma unidad condensadora teniendo así varias alternativas al momento de la selección considerando el área en donde vaya a operar cada unidad interior.
- La selección de este sistema se basó en el gran ahorro energético que puede representar la implementación de este, así como la disminución en niveles de ruido como de impacto ambiental.
- Mediante la implementación del sistema VRF, nos podemos dar cuenta que la inversión podría ser recuperable en un plazo corto ya que, solo considerando el ahorro en costo energético llegamos a ahorrar un valor aproximado de \$1527 mensuales, esto considerando que los sistemas trabajan a carga total. Notaremos un ahorro mayor sabiendo que el sistema VRF consta de compresores inverter los cuales no trabajan en todo momento a carga total sino a carga parcial permitiendo de esta forma ahorrar mucho más.

### 4.2 Recomendaciones

- Considerar todas las especificaciones que sean pertinentes al momento de realizar el cálculo de carga de calor ya que un mal cálculo de carga implicaría una mala selección del sistema por lo que conllevaría a un mal diseño.

- Realizar los planos a escala y con los detalles pertinentes ya que se trata de un trabajo de ingeniería completo.
- Una vez realizada toda la interconexión de unidades realizar el proceso de vacío para de esta forma remover todo el aire y agua en forma de humedad que pueda contener la línea de cañería, para realizar de manera correcta este proceso se deberá utilizar un vacuómetro el cual la lectura de este debe de llegar a un valor de 2.0 mm Hg.
- Realizar la carga de gas R410-A mediante el uso de una balanza, los valores de carga de gas del sistema se especifican en anexos, “manual de instalación sistema VRF”.
- Al momento de adquirir los equipos constatar que todos consten con los certificados internacionales AHRI ya que para este tipo de proyectos son fundamentales al momento de presentar la propuesta de diseño.
- Para el control centralizado, seguir al pie de la letra tanto en nomenclatura como en especificaciones de conexiones del “ESQUEMA ELECTRICO” incluido en el Apéndice E.

L = construcción ligera: Pared exterior de bastidores, losa de piso de concreto de 2 in, con aprox. 30 lb de material/ft<sup>2</sup> de piso.  
M = Construcción media: Pared exterior de concreto de 4 in, losa de piso de concreto de 4 in, con aprox. 70 lb de material de construcción por ft<sup>2</sup> de piso.  
H = Construcción pesada: Pared exterior de concreto de 6 in, losa de piso de concreto de 6 in, con aprox. 130 lb de material de construcción por ft<sup>2</sup> de piso.

## Cálculos de carga térmica con el programa Global VRF

| <b>Air System Sizing Summary for P2-4 Habitación 01</b> |  |         |
|---|--|---------|
| Project Name: The Garden Plaza Hotel                    |  | 03:02PM |
| Prepared by: Blue Air Technologies                      |  |         |

### Air System Information

Air System Name: P2-4 Habitación 01  
 Air System Type: Single Zone CAV

Number of zones: 1  
 Floor Area: 206.2 sqft  
 Location: Guayaquil, Ecuador

### Sizing Calculation Information

Calculation Months: Jan to Dec

Calculation method: Radiant Time Series

### Central Cooling Coil Sizing Data

Total coil load: 1.0 Tons  
 Total coil load: 12.1 MBH  
 Sensible coil load: 10.6 MBH  
 Coil airflow: 556 CFM  
 Sensible heat ratio: 0.874  
 Area per unit load: 204.9 sqft/Ton  
 Load per unit area: 58.6 BTU/(hr-sqft)

Load occurs at: Jun 1600  
 OA DB / WB: 82.6/70.9 F  
 Entering DB / WB: 72.9/61.9 F  
 Leaving DB / WB: 55.3/54.3 F  
 Coil ADP: 53.3 F  
 Bypass Factor: 0.100  
 Resulting RH: 53 %  
 Design supply temp: 55.0 F

### Supply Fan Sizing Data

Actual max airflow: 556 CFM  
 Standard airflow: 555 CFM  
 Actual max airflow per unit area: 2.70 CFM/sqft

Fan motor BHP: 0.05 BHP  
 Fan motor kW: 0.04 kW  
 Fan static: 0.30 in wg

### Outdoor Ventilation Air Data

Design airflow: 50 CFM  
 Airflow per unit floor area: 0.24 CFM/sqft

Airflow per person: 25.00 CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

## Air System Sizing Summary for P2-4 Habitación 02

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:02PM

### Air System Information

Air System Name: P2-4 Habitación 02  
Air System Type: Single Zone CAV

Number of zones: 1  
Floor Area: 158.0 sqft  
Location: Guayaquil, Ecuador

### Sizing Calculation Information

Calculation Months: Jan to Dec

Calculation method: Radiant Time Series

### Central Cooling Coil Sizing Data

Total coil load: 0.9 Tons  
Total coil load: 11.1 MBH  
Sensible coil load: 9.3 MBH  
Coil airflow: 495 CFM  
Sensible heat ratio: 0.840  
Area per unit load: 171.3 sqft/Ton  
Load per unit area: 70.1 BTU/(hr-sqft)

Load occurs at: May 1600  
OA DB / WB: 84.6/72.9 F  
Entering DB / WB: 73.0/62.4 F  
Leaving DB / WB: 55.6/54.6 F  
Coil ADP: 53.7 F  
Bypass Factor: 0.100  
Resulting RH: 54 %  
Design supply temp: 55.0 F

### Supply Fan Sizing Data

Actual max airflow: 495 CFM  
Standard airflow: 494 CFM  
Actual max airflow per unit area: 3.13 CFM/sqft

Fan motor BHP: 0.04 BHP  
Fan motor kW: 0.03 kW  
Fan static: 0.30 in wg

### Outdoor Ventilation Air Data

Design airflow: 50 CFM  
Airflow per unit floor area: 0.32 CFM/sqft

Airflow per person: 25.00 CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|--------------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

Leaving DB / WB: **55.3/54.3** F  
Coil ADP: **53.3** F  
Bypass Factor: **0.100**  
Resulting RH: **54** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **440** CFM  
Standard airflow: **439** CFM  
Actual max airflow per unit area: **3.00** CFM/sqft

Fan motor BHP: **0.04** BHP  
Fan motor kW: **0.03** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.34** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

## Air System Sizing Summary for P2-4 Habitación 04

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:18PM

### Air System Information

Air System Name: **P2-4 Habitación 04**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **180.8** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **0.9** Tons  
Total coil load: **11.2** MBH  
Sensible coil load: **9.4** MBH  
Coil airflow: **502** CFM  
Sensible heat ratio: **0.842**  
Area per unit load: **193.5** sqft/Ton  
Load per unit area: **62.0** BTU/(hr-sqft)

Load occurs at: **May 1500**  
OA DB / WB: **85.0/73.0** F  
Entering DB / WB: **73.1/62.4** F  
Leaving DB / WB: **55.6/54.6** F  
Coil ADP: **53.7** F  
Bypass Factor: **0.100**  
Resulting RH: **54** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **502** CFM  
Standard airflow: **501** CFM  
Actual max airflow per unit area: **2.77** CFM/sqft

Fan motor BHP: **0.04** BHP  
Fan motor kW: **0.03** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.28** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|--------------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Air System Sizing Summary for P2-4 Habitación 05

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:22PM

### Air System Information

Air System Name: P2-4 Habitación 05  
Air System Type: Single Zone CAV

Number of zones: 1  
Floor Area: 145.2 sqft  
Location: Guayaquil, Ecuador

### Sizing Calculation Information

Calculation Months: Jan to Dec

Calculation method: Radiant Time Series

### Central Cooling Coil Sizing Data

Total coil load: 0.8 Tons  
Total coil load: 9.9 MBH  
Sensible coil load: 8.4 MBH  
Coil airflow: 442 CFM  
Sensible heat ratio: 0.849  
Area per unit load: 175.3 sqft/Ton  
Load per unit area: 68.5 BTU/(hr-sqft)

Load occurs at: Jun 1600  
OA DB / WB: 82.6/70.9 F  
Entering DB / WB: 73.2/62.3 F  
Leaving DB / WB: 55.5/54.5 F  
Coil ADP: 53.5 F  
Bypass Factor: 0.100  
Resulting RH: 54 %  
Design supply temp: 55.0 F

### Supply Fan Sizing Data

Actual max airflow: 442 CFM  
Standard airflow: 441 CFM  
Actual max airflow per unit area: 3.04 CFM/sqft

Fan motor BHP: 0.04 BHP  
Fan motor kW: 0.03 kW  
Fan static: 0.30 in wg

### Outdoor Ventilation Air Data

Design airflow: 50 CFM  
Airflow per unit floor area: 0.34 CFM/sqft

Airflow per person: 25.00 CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|--------------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

### Central Cooling Coil Sizing Data

Total coil load: **1.2** Tons  
Total coil load: **14.1** MBH  
Sensible coil load: **12.0** MBH  
Coil airflow: **617** CFM  
Sensible heat ratio: **0.853**  
Area per unit load: **145.5** sqft/Ton  
Load per unit area: **82.5** BTU/(hr-sqft)

Load occurs at: **Dec 1500**  
OA DB / WB: **91.0/76.0** F  
Entering DB / WB: **73.5/62.4** F  
Leaving DB / WB: **55.5/54.4** F  
Coil ADP: **53.5** F  
Bypass Factor: **0.100**  
Resulting RH: **53** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **617** CFM  
Standard airflow: **616** CFM  
Actual max airflow per unit area: **3.62** CFM/sqft

Fan motor BHP: **0.05** BHP  
Fan motor kW: **0.04** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.29** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

## Air System Sizing Summary for P2-4 Pasillo

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:19PM

### Air System Information

Air System Name: **P2-4 Pasillo**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **535.5** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **1.1** Tons  
Total coil load: **12.9** MBH  
Sensible coil load: **12.0** MBH  
Coil airflow: **564** CFM  
Sensible heat ratio: **0.930**  
Area per unit load: **496.5** sqft/Ton  
Load per unit area: **24.2** BTU/(hr-sqft)

Load occurs at: **Jan 1600**  
OA DB / WB: **91.6/75.9** F  
Entering DB / WB: **75.2/62.3** F  
Leaving DB / WB: **55.4/54.2** F  
Coil ADP: **53.3** F  
Bypass Factor: **0.100**  
Resulting RH: **48** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **564** CFM  
Standard airflow: **564** CFM  
Actual max airflow per unit area: **1.05** CFM/sqft

Fan motor BHP: **0.05** BHP  
Fan motor kW: **0.04** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **0** CFM  
Airflow per unit floor area: **0.00** CFM/sqft

Airflow per person: **0.00** CFM/person

### Space Sizing Data

| Space Name   | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

| P2-4 Pasillo | 12052                     | Cooling     | 75.2        | 564              | 0                       |

## Air System Sizing Summary for P2 Hall - A. Espera

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:21PM

### Air System Information

Air System Name: P2 Hall - A. Espera  
Air System Type: Single Zone CAV

Number of zones: 1  
Floor Area: 613.3 sqft  
Location: Guayaquil, Ecuador

### Sizing Calculation Information

Calculation Months: Jan to Dec

Calculation method: Radiant Time Series

### Central Cooling Coil Sizing Data

Total coil load: 1.6 Tons  
Total coil load: 19.2 MBH  
Sensible coil load: 15.8 MBH  
Coil airflow: 832 CFM  
Sensible heat ratio: 0.827  
Area per unit load: 384.2 sqft/Ton  
Load per unit area: 31.2 BTU/(hr-sqft)

Load occurs at: Jan 1000  
OA DB / WB: 84.6/74.0 F  
Entering DB / WB: 73.2/62.5 F  
Leaving DB / WB: 55.5/54.5 F  
Coil ADP: 53.6 F  
Bypass Factor: 0.100  
Resulting RH: 55 %  
Design supply temp: 55.0 F

### Supply Fan Sizing Data

Actual max airflow: 832 CFM  
Standard airflow: 831 CFM  
Actual max airflow per unit area: 1.36 CFM/sqft

Fan motor BHP: 0.07 BHP  
Fan motor kW: 0.05 kW  
Fan static: 0.30 in wg

### Outdoor Ventilation Air Data

Design airflow: 50 CFM  
Airflow per unit floor area: 0.08 CFM/sqft

Airflow per person: 6.25 CFM/person

### Space Sizing Data

| Space Name          | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|---------------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Air System Sizing Summary for P2-5 Habitación 09

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:10PM

### Air System Information

Air System Name: **P2-5 Habitación 09**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **173.3** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **1.1** Tons  
Total coil load: **12.9** MBH  
Sensible coil load: **10.8** MBH  
Coil airflow: **549** CFM  
Sensible heat ratio: **0.839**  
Area per unit load: **161.1** sqft/Ton  
Load per unit area: **74.5** BTU/(hr-sqft)

Load occurs at: **Dec 1500**  
OA DB / WB: **91.0/76.0** F  
Entering DB / WB: **73.7/62.6** F  
Leaving DB / WB: **55.4/54.4** F  
Coil ADP: **53.4** F  
Bypass Factor: **0.100**  
Resulting RH: **53** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **549** CFM  
Standard airflow: **548** CFM  
Actual max airflow per unit area: **3.17** CFM/sqft

Fan motor BHP: **0.05** BHP  
Fan motor kW: **0.04** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.29** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

## Air System Sizing Summary for P2-5 Habitación 10

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:14PM

### Air System Information

Air System Name: **P2-5 Habitación 10**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **177.5** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **0.9** Tons  
Total coil load: **10.2** MBH  
Sensible coil load: **8.2** MBH  
Coil airflow: **399** CFM  
Sensible heat ratio: **0.799**  
Area per unit load: **208.4** sqft/Ton  
Load per unit area: **57.6** BTU/(hr-sqft)

Load occurs at: **Dec 1500**  
OA DB / WB: **91.0/76.0** F  
Entering DB / WB: **74.4/63.2** F  
Leaving DB / WB: **55.4/54.4** F  
Coil ADP: **53.3** F  
Bypass Factor: **0.100**  
Resulting RH: **54** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **399** CFM  
Standard airflow: **398** CFM  
Actual max airflow per unit area: **2.25** CFM/sqft

Fan motor BHP: **0.03** BHP  
Fan motor kW: **0.03** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.28** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|--------------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Air System Sizing Summary for P2-5 Habitación 11

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:12PM

### Air System Information

Air System Name: **P2-5 Habitación 11**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **216.0** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **1.1** Tons  
Total coil load: **13.5** MBH  
Sensible coil load: **11.4** MBH  
Coil airflow: **584** CFM  
Sensible heat ratio: **0.846**  
Area per unit load: **191.5** sqft/Ton  
Load per unit area: **62.7** BTU/(hr-sqft)

Load occurs at: **Dec 1400**  
OA DB / WB: **90.6/75.9** F  
Entering DB / WB: **73.5/62.4** F  
Leaving DB / WB: **55.3/54.3** F  
Coil ADP: **53.3** F  
Bypass Factor: **0.100**  
Resulting RH: **53** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **584** CFM  
Standard airflow: **583** CFM  
Actual max airflow per unit area: **2.70** CFM/sqft

Fan motor BHP: **0.05** BHP  
Fan motor kW: **0.04** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.23** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

## Air System Sizing Summary for P2-5 Habitación 12

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:12PM

### Air System Information

Air System Name: **P2-5 Habitación 12**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **173.3** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **1.1** Tons  
Total coil load: **12.9** MBH  
Sensible coil load: **10.8** MBH  
Coil airflow: **549** CFM  
Sensible heat ratio: **0.839**  
Area per unit load: **161.1** sqft/Ton  
Load per unit area: **74.5** BTU/(hr-sqft)

Load occurs at: **Dec 1500**  
OA DB / WB: **91.0/76.0** F  
Entering DB / WB: **73.7/62.6** F  
Leaving DB / WB: **55.4/54.4** F  
Coil ADP: **53.4** F  
Bypass Factor: **0.100**  
Resulting RH: **53** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **549** CFM  
Standard airflow: **548** CFM  
Actual max airflow per unit area: **3.17** CFM/sqft

Fan motor BHP: **0.05** BHP  
Fan motor kW: **0.04** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.29** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|--------------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|
| P2-5 Habitación 12 | 9.8                          | 549                | Dec 1500          | 0.2                      | 173.3                 | 3.17           |

## Air System Sizing Summary for P2-5 Habitación 13

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:08PM

### Air System Information

Air System Name: P2-5 Habitación 13  
Air System Type: Single Zone CAV

Number of zones: 1  
Floor Area: 191.1 sqft  
Location: Guayaquil, Ecuador

### Sizing Calculation Information

Calculation Months: Jan to Dec

Calculation method: Radiant Time Series

### Central Cooling Coil Sizing Data

Total coil load: 1.0 Tons  
Total coil load: 12.4 MBH  
Sensible coil load: 10.4 MBH  
Coil airflow: 532 CFM  
Sensible heat ratio: 0.835  
Area per unit load: 185.0 sqft/Ton  
Load per unit area: 64.9 BTU/(hr-sqft)

Load occurs at: Dec 1400  
OA DB / WB: 90.6/75.9 F  
Entering DB / WB: 73.8/62.8 F  
Leaving DB / WB: 55.8/54.7 F  
Coil ADP: 53.8 F  
Bypass Factor: 0.100  
Resulting RH: 54 %  
Design supply temp: 55.0 F

### Supply Fan Sizing Data

Actual max airflow: 532 CFM  
Standard airflow: 531 CFM  
Actual max airflow per unit area: 2.78 CFM/sqft

Fan motor BHP: 0.05 BHP  
Fan motor kW: 0.03 kW  
Fan static: 0.30 in wg

### Outdoor Ventilation Air Data

Design airflow: 50 CFM  
Airflow per unit floor area: 0.26 CFM/sqft

Airflow per person: 25.00 CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|--------------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Air System Sizing Summary for P3-5 Habitación 15

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

03:06PM

### Air System Information

Air System Name: **P3-5 Habitación 15**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **226.5** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **1.2** Tons  
Total coil load: **14.0** MBH  
Sensible coil load: **11.9** MBH  
Coil airflow: **597** CFM  
Sensible heat ratio: **0.849**  
Area per unit load: **193.5** sqft/Ton  
Load per unit area: **62.0** BTU/(hr-sqft)

Load occurs at: **Dec 1500**  
OA DB / WB: **91.0/76.0** F  
Entering DB / WB: **73.3/62.0** F  
Leaving DB / WB: **54.8/53.8** F  
Coil ADP: **52.8** F  
Bypass Factor: **0.100**  
Resulting RH: **53** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **597** CFM  
Standard airflow: **597** CFM  
Actual max airflow per unit area: **2.64** CFM/sqft

Fan motor BHP: **0.05** BHP  
Fan motor kW: **0.04** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.22** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name         | Maximum Cooling Sensible Load MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|--------------------|-----------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Air System Sizing Summary for P2-5 Sala de Espera

Project Name: The Garden Plaza Hotel  
 Prepared by: Blue Air Technologies

03:04PM

### Air System Information

Air System Name: **P2-5 Sala de Espera**  
 Air System Type: **Single Zone CAV**

Number of zones: **1**  
 Floor Area: **145.4** sqft  
 Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **1.1** Tons  
 Total coil load: **13.8** MBH  
 Sensible coil load: **13.3** MBH  
 Coil airflow: **725** CFM  
 Sensible heat ratio: **0.968**  
 Area per unit load: **126.9** sqft/Ton  
 Load per unit area: **94.6** BTU/(hr-sqft)

Load occurs at: **Jun 1400**  
 OA DB / WB: **82.6/70.9** F  
 Entering DB / WB: **72.4/61.0** F  
 Leaving DB / WB: **55.4/54.3** F  
 Coil ADP: **53.5** F  
 Bypass Factor: **0.100**  
 Resulting RH: **52** %  
 Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **725** CFM  
 Standard airflow: **724** CFM  
 Actual max airflow per unit area: **4.98** CFM/sqft

Fan motor BHP: **0.06** BHP  
 Fan motor kW: **0.05** kW  
 Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **0** CFM  
 Airflow per unit floor area: **0.00** CFM/sqft

Airflow per person: **0.00** CFM/person

### Space Sizing Data

| Space Name          | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

## Air System Sizing Summary for P5 Habitación 01

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

09:29AM

### Air System Information

Air System Name: **P5 Habitación 01**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **206.2** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **1.0** Tons  
Total coil load: **12.2** MBH  
Sensible coil load: **10.7** MBH  
Coil airflow: **563** CFM  
Sensible heat ratio: **0.875**  
Area per unit load: **202.9** sqft/Ton  
Load per unit area: **59.1** BTU/(hr-sqft)

Load occurs at: **Jun 1600**  
OA DB / WB: **82.6/70.9** F  
Entering DB / WB: **72.9/61.9** F  
Leaving DB / WB: **55.3/54.3** F  
Coil ADP: **53.4** F  
Bypass Factor: **0.100**  
Resulting RH: **53** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **563** CFM  
Standard airflow: **562** CFM  
Actual max airflow per unit area: **2.73** CFM/sqft

Fan motor BHP: **0.05** BHP  
Fan motor kW: **0.04** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.24** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name       | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|------------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Air System Sizing Summary for P5 Habitación 02

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

09:29AM

### Air System Information

Air System Name: **P5 Habitación 02**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **158.0** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **0.9** Tons  
Total coil load: **11.1** MBH  
Sensible coil load: **9.6** MBH  
Coil airflow: **504** CFM  
Sensible heat ratio: **0.864**  
Area per unit load: **171.2** sqft/Ton  
Load per unit area: **70.1** BTU/(hr-sqft)

Load occurs at: **Jun 1600**  
OA DB / WB: **82.6/70.9** F  
Entering DB / WB: **73.0/62.1** F  
Leaving DB / WB: **55.4/54.4** F  
Coil ADP: **53.5** F  
Bypass Factor: **0.100**  
Resulting RH: **54** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **504** CFM  
Standard airflow: **504** CFM  
Actual max airflow per unit area: **3.19** CFM/sqft

Fan motor BHP: **0.04** BHP  
Fan motor kW: **0.03** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.32** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name       | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

## Air System Sizing Summary for P5 Habitación 03

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

09:29AM

### Air System Information

Air System Name: **P5 Habitación 03**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **146.6** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **0.9** Tons  
Total coil load: **10.4** MBH  
Sensible coil load: **8.6** MBH  
Coil airflow: **454** CFM  
Sensible heat ratio: **0.830**  
Area per unit load: **168.9** sqft/Ton  
Load per unit area: **71.0** BTU/(hr-sqft)

Load occurs at: **May 1600**  
OA DB / WB: **84.6/72.9** F  
Entering DB / WB: **73.2/62.5** F  
Leaving DB / WB: **55.5/54.5** F  
Coil ADP: **53.6** F  
Bypass Factor: **0.100**  
Resulting RH: **54** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **454** CFM  
Standard airflow: **453** CFM  
Actual max airflow per unit area: **3.09** CFM/sqft

Fan motor BHP: **0.04** BHP  
Fan motor kW: **0.03** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.34** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name       | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|------------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Air System Sizing Summary for P5 Habitación 04

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

09:28AM

### Air System Information

Air System Name: **P5 Habitación 04**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **180.8** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **1.0** Tons  
Total coil load: **11.5** MBH  
Sensible coil load: **9.7** MBH  
Coil airflow: **515** CFM  
Sensible heat ratio: **0.846**  
Area per unit load: **189.3** sqft/Ton  
Load per unit area: **63.4** BTU/(hr-sqft)

Load occurs at: **May 1600**  
OA DB / WB: **84.6/72.9** F  
Entering DB / WB: **73.1/62.4** F  
Leaving DB / WB: **55.6/54.6** F  
Coil ADP: **53.7** F  
Bypass Factor: **0.100**  
Resulting RH: **54** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **515** CFM  
Standard airflow: **514** CFM  
Actual max airflow per unit area: **2.85** CFM/sqft

Fan motor BHP: **0.05** BHP  
Fan motor kW: **0.03** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.28** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name       | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

## Air System Sizing Summary for P5 Habitación 05

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

09:36AM

### Air System Information

Air System Name: **P5 Habitación 05**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **145.2** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **0.8** Tons  
Total coil load: **10.0** MBH  
Sensible coil load: **8.3** MBH  
Coil airflow: **449** CFM  
Sensible heat ratio: **0.831**  
Area per unit load: **173.5** sqft/Ton  
Load per unit area: **69.2** BTU/(hr-sqft)

Load occurs at: **May 1600**  
OA DB / WB: **84.6/72.9** F  
Entering DB / WB: **73.5/63.0** F  
Leaving DB / WB: **56.3/55.3** F  
Coil ADP: **54.4** F  
Bypass Factor: **0.100**  
Resulting RH: **55** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **449** CFM  
Standard airflow: **449** CFM  
Actual max airflow per unit area: **3.09** CFM/sqft

Fan motor BHP: **0.04** BHP  
Fan motor kW: **0.03** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.34** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

| Space Name       | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

## Air System Sizing Summary for P5 Habitación 07

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

09:38AM

### Air System Information

Air System Name: **P5 Habitación 07**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **134.1** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **0.9** Tons  
Total coil load: **10.2** MBH  
Sensible coil load: **8.4** MBH  
Coil airflow: **441** CFM  
Sensible heat ratio: **0.827**  
Area per unit load: **157.6** sqft/Ton  
Load per unit area: **76.2** BTU/(hr-sqft)

Load occurs at: **May 1600**  
OA DB / WB: **84.6/72.9** F  
Entering DB / WB: **73.3/62.6** F  
Leaving DB / WB: **55.6/54.5** F  
Coil ADP: **53.6** F  
Bypass Factor: **0.100**  
Resulting RH: **54** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **441** CFM  
Standard airflow: **441** CFM  
Actual max airflow per unit area: **3.29** CFM/sqft

Fan motor BHP: **0.04** BHP  
Fan motor kW: **0.03** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **50** CFM  
Airflow per unit floor area: **0.37** CFM/sqft

Airflow per person: **25.00** CFM/person

### Space Sizing Data

## Air System Sizing Summary for P5 Habitación 08

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

09:48AM

### Air System Information

Air System Name: **P5 Habitación 08**      Number of zones: **1**  
Air System Type: **Single Zone CAV**      Floor Area: **170.5** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**      Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

|                      |                           |                     |                    |
|----------------------|---------------------------|---------------------|--------------------|
| Total coil load:     | <b>1.2</b> Tons           | Load occurs at:     | <b>Dec 1600</b>    |
| Total coil load:     | <b>14.5</b> MBH           | OA DB / WB:         | <b>90.6/75.9</b> F |
| Sensible coil load:  | <b>12.5</b> MBH           | Entering DB / WB:   | <b>73.4/62.3</b> F |
| Coil airflow:        | <b>638</b> CFM            | Leaving DB / WB:    | <b>55.4/54.3</b> F |
| Sensible heat ratio: | <b>0.857</b>              | Coil ADP:           | <b>53.3</b> F      |
| Area per unit load:  | <b>140.7</b> sqft/Ton     | Bypass Factor:      | <b>0.100</b>       |
| Load per unit area:  | <b>85.3</b> BTU/(hr-sqft) | Resulting RH:       | <b>53</b> %        |
|                      |                           | Design supply temp: | <b>55.0</b> F      |

### Supply Fan Sizing Data

|                                   |                      |                |                   |
|-----------------------------------|----------------------|----------------|-------------------|
| Actual max airflow:               | <b>638</b> CFM       | Fan motor BHP: | <b>0.06</b> BHP   |
| Standard airflow:                 | <b>638</b> CFM       | Fan motor kW:  | <b>0.04</b> kW    |
| Actual max airflow per unit area: | <b>3.74</b> CFM/sqft | Fan static:    | <b>0.30</b> in wg |

### Outdoor Ventilation Air Data

Design airflow: **50** CFM      Airflow per person: **25.00** CFM/person  
Airflow per unit floor area: **0.29** CFM/sqft

### Space Sizing Data

| Space Name       | Maximum Cooling Sensible Load MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|------------------|-----------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Air System Sizing Summary for P5 Pasillo

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

10:37AM

### Air System Information

Air System Name: **P5 Pasillo**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **535.5** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **1.1** Tons  
Total coil load: **13.3** MBH  
Sensible coil load: **12.4** MBH  
Coil airflow: **581** CFM  
Sensible heat ratio: **0.932**  
Area per unit load: **482.5** sqft/Ton  
Load per unit area: **24.9** BTU/(hr-sqft)

Load occurs at: **Feb 1600**  
OA DB / WB: **91.6/75.9** F  
Entering DB / WB: **75.3/62.3** F  
Leaving DB / WB: **55.5/54.3** F  
Coil ADP: **53.3** F  
Bypass Factor: **0.100**  
Resulting RH: **48** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **581** CFM  
Standard airflow: **581** CFM  
Actual max airflow per unit area: **1.09** CFM/sqft

Fan motor BHP: **0.05** BHP  
Fan motor kW: **0.04** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **0** CFM  
Airflow per unit floor area: **0.00** CFM/sqft

Airflow per person: **0.00** CFM/person

### Space Sizing Data

| Space Name | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Air System Sizing Summary for Terraza Gimnasio

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

01:10PM

### Air System Information

Air System Name: **Terraza Gimnasio**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **267.6** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **2.9** Tons  
Total coil load: **34.9** MBH  
Sensible coil load: **33.7** MBH  
Coil airflow: **1555** CFM  
Sensible heat ratio: **0.965**  
Area per unit load: **92.0** sqft/Ton  
Load per unit area: **130.4** BTU/(hr-sqft)

Load occurs at: **Jun 1600**  
OA DB / WB: **82.6/70.9** F  
Entering DB / WB: **75.4/62.0** F  
Leaving DB / WB: **55.3/54.1** F  
Coil ADP: **53.1** F  
Bypass Factor: **0.100**  
Resulting RH: **47** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **1555** CFM  
Standard airflow: **1554** CFM  
Actual max airflow per unit area: **5.81** CFM/sqft

Fan motor BHP: **0.14** BHP  
Fan motor kW: **0.10** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **0** CFM  
Airflow per unit floor area: **0.00** CFM/sqft

Airflow per person: **0.00** CFM/person

### Space Sizing Data

| Space Name       | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|------------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Air System Sizing Summary for Terraza Hall

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

01:08PM

### Air System Information

Air System Name: **Terraza Hall**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **793.2** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **2.8** Tons  
Total coil load: **33.6** MBH  
Sensible coil load: **24.2** MBH  
Coil airflow: **1050** CFM  
Sensible heat ratio: **0.719**  
Area per unit load: **283.0** sqft/Ton  
Load per unit area: **42.4** BTU/(hr-sqft)

Load occurs at: **Feb 1600**  
OA DB / WB: **91.6/75.9** F  
Entering DB / WB: **77.0/65.4** F  
Leaving DB / WB: **55.6/54.6** F  
Coil ADP: **53.2** F  
Bypass Factor: **0.100**  
Resulting RH: **54** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **1050** CFM  
Standard airflow: **1049** CFM  
Actual max airflow per unit area: **1.32** CFM/sqft

Fan motor BHP: **0.09** BHP  
Fan motor kW: **0.07** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **250** CFM  
Airflow per unit floor area: **0.32** CFM/sqft

Airflow per person: **31.25** CFM/person

### Space Sizing Data

| Space Name   | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |

## Air System Sizing Summary for Terraza Mesas

Project Name: The Garden Plaza Hotel  
Prepared by: Blue Air Technologies

01:07PM

### Air System Information

Air System Name: **Terraza Mesas**  
Air System Type: **Single Zone CAV**

Number of zones: **1**  
Floor Area: **1013.5** sqft  
Location: **Guayaquil, Ecuador**

### Sizing Calculation Information

Calculation Months: **Jan to Dec**

Calculation method: **Radiant Time Series**

### Central Cooling Coil Sizing Data

Total coil load: **9.1** Tons  
Total coil load: **108.8** MBH  
Sensible coil load: **80.7** MBH  
Coil airflow: **3815** CFM  
Sensible heat ratio: **0.741**  
Area per unit load: **111.7** sqft/Ton  
Load per unit area: **107.4** BTU/(hr-sqft)

Load occurs at: **Feb 1700**  
OA DB / WB: **90.7/75.6** F  
Entering DB / WB: **74.9/64.1** F  
Leaving DB / WB: **55.3/54.3** F  
Coil ADP: **53.1** F  
Bypass Factor: **0.100**  
Resulting RH: **56** %  
Design supply temp: **55.0** F

### Supply Fan Sizing Data

Actual max airflow: **3815** CFM  
Standard airflow: **3811** CFM  
Actual max airflow per unit area: **3.76** CFM/sqft

Fan motor BHP: **0.33** BHP  
Fan motor kW: **0.25** kW  
Fan static: **0.30** in wg

### Outdoor Ventilation Air Data

Design airflow: **550** CFM  
Airflow per unit floor area: **0.54** CFM/sqft

Airflow per person: **13.75** CFM/person

### Space Sizing Data

| Space Name    | Maximum Cooling Sensible MBH | Design Airflow CFM | Time of Peak Load | Maximum Heating Load MBH | Space Floor Area sqft | Space CFM/sqft |
|---------------|------------------------------|--------------------|-------------------|--------------------------|-----------------------|----------------|

## Catálogos

### Máxima Eficiencia

La incorporación de 13 nuevos componentes en el compresor mejora su eficiencia en un 4.6%.

La tecnología de control inteligente del compresor ayuda a mejorar la precisión de la frecuencia a intervalos de +/-0,1 Hz y a reducir el consumo de energía.

La eficiencia a carga plena máxima aumento a 5.21 w/w.

### Experiencia Confortable

El nuevo diseño de la cámara silenciadora del compresor y la nueva forma de las aspas del ventilador de la unidad exterior, reducen sustancialmente el nivel de ruido y contribuyen a una operación estable del Sistema.

#### Compresor:

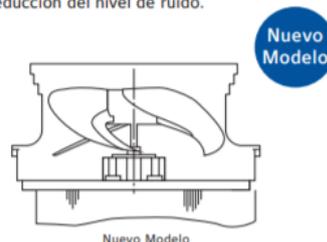

La nueva cámara silenciadora del compresor reduce el nivel de presión de ruido hasta en 2 dB(A).

Nueva Cámara Silenciadora

#### Ventilador de la Unidad Exterior:

La nueva forma de las aspas del ventilador de la unidad exterior contribuye a la reducción del nivel de ruido.

Nuevo Modelo

### Flexibilidad de diseño

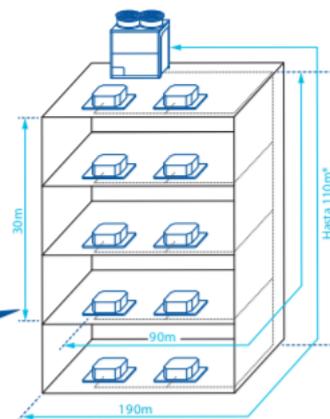

Mejora en el alcance de tubería vertical que se puede instalar entre las unidades interiores y la exterior de hasta 110 m\*. La aplicación es apropiada para edificios de gran altura, ahorra tiempo de diseño de los sistemas debido a la mejora en las restricciones de tubería en verticales del sistema.

|   |  |
|---|--|
| Longitud total de tubería                                 | 1000m                                      |
| Máxima longitud real (equivalente)                        | 165m (190m)                                |
| Entre el "Multi-kit del primer ramal" y la IDU más lejana | 90m  |
| Entre ODU's e IDU's                                       | ODU mayor    Estandar 50m Opcional 110m(*) |
|   | ODU menor     40m                          |
| Entre IDU's   | 30m  |

Las longitudes máximas o diferencias de alturas están sujetas a diversas condiciones. Haga referencia a los documentos técnicos para consultarlas.

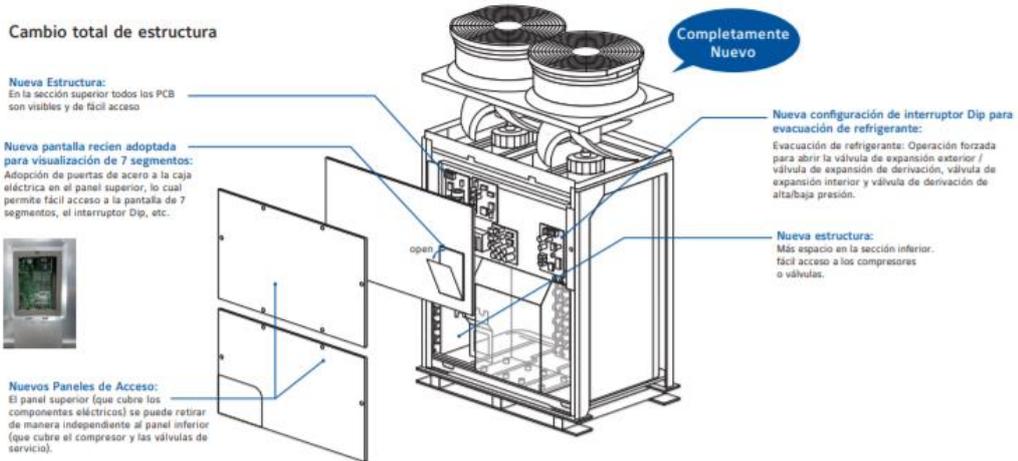

\*Consulte a su distribuidor o representante si la diferencia de alturas es mayor a 50m.

- Aplicación es apropiada para edificios de gran altura.
- Mayores alcances para ahorra tiempo en el diseño del Sistema.

## Fácil Mantenimiento

La pantalla de 7 segmentos facilita al técnico instalador o de servicio, las pruebas de arranque y los diagnósticos en caso de una falla en el sistema. La distribución de los componentes internos de la unidad exterior permite contar con el espacio suficiente para facilitar las labores de mantenimiento e instalación.

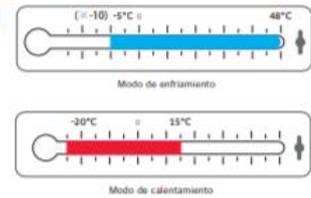

Incremento en el rango de operación de temperatura exterior del aire para el modo de enfriamiento.

|                                     |            |                          |
|-------------------------------------|------------|--------------------------|
| Rango de capacidad de enfriamiento  | °C DB (°F) | (-10) -5 a 48 (23 a 118) |
| Rango de capacidad de calentamiento | °C WB (°F) | -20 a 15 (-4 a 59)       |

※ Con configuración para baja temperatura ambiente

## Control Inteligente

Los sistemas YORK VRF ofrecen una amplia gama de sistemas de control para múltiples aplicaciones.

## 2. MULTI-KIT

Branching for indoor and outdoor connecting pipes

### Line branch

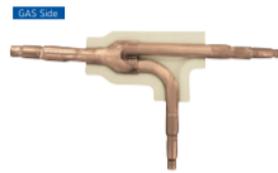

#### First branching pipes

| Outdoor Unit HP | Model      |
|-----------------|------------|
| 8 ~ 10          | MW-NP28A3  |
| 12 ~ 16         | MW-NP42A3  |
| 18 ~ 24         | MW-NP62A3  |
| 26 ~ 34         | MW-NP92A3  |
| 36 ~ 48         | MW-NP122A3 |

#### Pipe diameter after the first branch and multi-kit

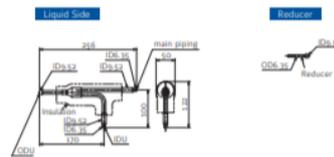

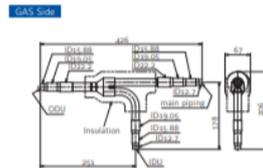

| Total Indoor Unit HP | Diameter (mm) |             | Model      |
|----------------------|---------------|-------------|------------|
|                      | Gas Pipe      | Liquid Pipe |            |
| < 6                  | Φ15.88        | Φ9.52       | MW-NP28A3  |
| 6 ~ 8.99             | Φ19.05        | Φ9.52       |            |
| 9 ~ 11.99            | Φ22.2         | Φ9.52       |            |
| 12 ~ 15.99           | Φ25.4         | Φ12.7       | MW-NP42A3  |
| 16 ~ 17.99           | Φ28.58        | Φ12.7       | MW-NP62A3  |
| 18 ~ 25.99           | Φ28.58        | Φ15.88      |            |
| 26 ~ 35.99           | Φ31.75        | Φ15.05      | MW-NP92A3  |
| 36 ~ 45.99           | Φ38.1         | Φ15.05      | MW-NP122A3 |
| 46 ~ 67.99           | Φ44.45        | Φ15.05      |            |
| 68 ~ 72              | Φ44.45        | Φ22.2       | MW-NP282A3 |
| 74 ~ 88              | Φ50.8         | Φ22.2       |            |
| 90                   | Φ50.8         | Φ25.4       |            |

### Header branch

| Multi-Kit Model | Total IDU HP | No. of Header branches | Remarks     |
|-----------------|--------------|------------------------|-------------|
| JMH-NP280X      | 5 ~ 10       | 8                      | For 3 pipes |
| JMH-NP224A      | 5 ~ 8        | 4                      | For 2 pipes |
| JMH-NP280A      | 5 ~ 10       | 8                      |             |

Images: JMH-NP224A

(2) Charging Work

Charge the system with refrigerant R410A according to Item 8.4.

(3) Record of Additional Refrigerant Charge

Total refrigerant charge of this system is calculated in the following formula.

$$\text{Total Ref. Charge} = W + W0$$

$$\text{This System} = \square + \square = \square \text{ kg}$$

Total Additional Ref. Charge: W  kg

Total Ref. Charge:  kg

Date of Ref. Charge Work:  /  /

< Ref. Charge Amount of O.U. Before Shipment (W0) kg >

| Outdoor Unit (HP) | W0 Outdoor Unit Ref. Charge (kg) |
|-------------------|----------------------------------|
| 8                 | 5.0                              |
| 10                | 5.0                              |
| 12                | 7.2                              |
| 14                | 8.9                              |
| 16                | 9.9                              |
| 18                | 10.7                             |
| 20                | 11.3                             |
| 22                | 11.3                             |
| 24                | 11.6                             |

NOTE:

• W0 is outdoor unit ref. charge before shipment.

• In case of the combination of the base units, calculate the total ref. charge before shipment of the outdoor units to be combined.
